NEW!

**INTERNAL*
OR EXTERNAL
WRENCHING
HEX NUTS**

KAYLOCK

all-metal self-locking nuts

LIGHT WEIGHT • FULL STRENGTH • LOW HEIGHT

Another Kaynar first—the new KAYLOCK HEX NUT provides a substantial reduction in wrench clearances required for installation of AN363, AN364 and AN365 self-locking nuts. (Counter bore diameters, spot face diameters and edge distances may be greatly reduced.)

*Use internal wrench when access is limited.
Write for information on Wrenches.

Kaylock nuts are precision products produced in full conformance with Air Force-Navy specifications AN-N-5 and AN-N-10. For more information, write for our catalog.

Ever hear the one about the mechanical mule?

New vehicle makes light work of ground-handling huge lighter-than-air craft

There was a time when docking and undocking an airship was a daunting proposition—a chore requiring the manpower of a large ground crew.

Now Goodyear Aircraft Corporation, working with the Navy, has come up with the "Mechanical Mule"—a 4-wheel drive vehicle expressly designed for ground-handling and docking of airships.

Mounted with a huge cable-drum which works on the principle of a derrick end, this mule never "balks"—keeps a positive yet gentle tension on the handling-line which is attached to the airship envelope.

As a result, a pair of Mechanical Mules—working on wheels which enter to permit "creeper" travel—can

perform ground-handling duties which previously required 30-100 men.

The Mechanical Mule is an important contribution to the ever-growing airship program—an excellent example of the economy and conservation of manpower being exercised by the Defense Department.

It represents an important step forward in utilizing the versatile vigilance and unattended station-keeping qualities of lighter-than-air craft in this nation's defense network.

It also shows how Goodyear Aircraft works to develop complete systems—and better performance per dollar—for the products it turns out in the service of its customers.

They're doing big things at

GOODYEAR AIRCRAFT

Goodyear Aircraft Corporation, Plants in Akron, Ohio, and Lockfield Park, Arizona

Complete auxiliary power

in one system

This self contained power system provides economical and efficient operation of vital components on aircraft and missiles. Power to start main engines... power for cabin air conditioning on the ground and in flight... power for electronics, electrical and hydraulic applications... emergency power for operating control systems.

As in other AirResearch aircraft and missile systems, the components in this power system are designed and manufactured to operate with absolute compatibility with one another.

This involves top performance and ease of maintenance—a unique advantage because only AirResearch has the broad range of development, manufacturing, operational, and service experience to make it possible.

• Qualified engineers in the fields listed below are needed now. Write for information

HEART OF THE AIRRESEARCH AUXILIARY POWER SYSTEM

This small gas turbine compressor power unit supplies both compressed air and shaft power, has proven diversity on the ground as well as in the air.

AirResearch Manufacturing Divisions Los Angeles 46, California • Phoenix, Arizona

Designers and manufacturers of aircraft systems and components, navigation systems, engine and engine air systems, transmission systems

Computation... reputation... and the dynamics of defense

Whether to guide a missile, to detect an enemy, to navigate a plane or to light a gun... modern defense systems depend on computation.

And computation is Burroughs' business. It is the basis of our worldwide reputation for outstanding high-speed business machines... and of our recognition in the advanced fields of electronics and magnetics.

Today, with the continual change in defense concepts, Burroughs' progressive experience and integrated facilities are of increased value. They enable us to accept the prime responsibility for Armed Forces projects—from analysis and research, through development, engineering and tooling... into production, testing, field service and training.

In the fields of instrumentation, control systems, communications, electronic computation and data processing, we have proved our ability on some of the most far-reaching assignments. Please address inquiries to Burroughs Corporation, Detroit 32, Michigan.

BURROUGHS INTEGRATED OFFICE FACILITIES INCLUDE:

Burroughs Corporation plants in Detroit and Plymouth, Michigan
Burroughs Research Center, Folsom, Pennsylvania
Burroughs Electronics Instruments Division, Philadelphia, Pennsylvania
Control Instrument Company, Brooklyn, New York
Hoyt Brothers of New Jersey, Parsippany, New Jersey
The Todd Company, Inc., Rochester, N. Y.

Burroughs

*The Foremost Name
in Computation*

Looking to future expansion, Burroughs seeks capable, experienced engineers.

**Ask a maintenance superintendent
why he likes Douglas service!**

He'll tell you

...Douglas Service people help him plan his maintenance and overhaul program and inform him on the latest techniques developed by the factory. ... Douglas field representatives are permanent, and he can depend on them as a basic factor in his organization. They not only help on new airplanes, but on old, too.

Through our Field Service organization, we maintain a continuing and permanent interest in seeing that Douglas customers achieve maximum utilization of all Douglas aircraft. Our permanent service representatives for commercial aircraft are located in 20 major transportation centers throughout the world.

Now Available...

FIRST HF TRANSISTORS
now in production, meeting
Army Signal Corps Standards

PHILCO SBT
SURFACE BARRIER TRANSISTORS
(Type 2N128 and 2N129)

Meet MIL-T-12679A Military requirements

Check These Features

- High frequency performance
- Extreme reliability
- Uniformity of characteristics
- Tight quality control
- Minimum battery drain
- Low leakage currents
- Low operating voltage
- Absolute hermetic seal
- Meets MIL-T-12679A Military requirements

Now available for high volume military and industrial applications... the high frequency Philco Surface Barrier Transistors that were developed for the Army Signal Corps to meet the stringent requirements of field use in military electronic equipment. Advanced, precision techniques used in fabricating the Philco Surface Barrier Transistors make possible significantly increased performance with no increase in size, weight, reliability and high volume production. These reliable transistors point the way to new fields in communication. Make these reliable high frequency Philco Surface Barrier Transistors part of your forward looking plans.

For complete technical information on these High Frequency Transistors write Dept. AW-3, LANSDALE TUBE CO., Lansdale, Pa. A Division of MICO CORP.

WORLD'S SMALLEST

Subminiature Precision

RATE GYROS

Many thousands currently used in:

GUIDED MISSILES • ANTENNA STABILIZATION • AUTOPILOTS
DAMPEN SYSTEMS • STABLE PLATFORMS

LESS THAN **1** INCH DIAMETER

LESS THAN **2** 3/16 INCHES LONG

WEIGHS ONLY **3** 1/2 OUNCES

Designed by SANDERS ASSOCIATES
Precision built by U. S. TIME

This precision rate gyro affords the missile and weapon systems manufacturer the most advanced state of the art development in size and weight reduction—without sacrificing performance—and is readily available in mass production quantities.

Performance characteristics can be modified to suit your specific requirements.

A new edition of our technical data booklet is available upon request.

THE UNITED STATES TIME CORPORATION

World's largest manufacturer of watches and mechanical time piece

Sales Office • 580 Fifth Avenue, New York • Palo Verde, California.

Plants • Middletown and Waterbury, Conn. • Little Rock, Ark. • Alabama, Tenn. • Toronto, Can. • Dundee, Scotland.

- Flight proven under the most severe environmental conditions
- Readily meets MIL-E-8758A specs.
- Reliability proven in many calibration laboratory and "in flight" tests
- Available in many Rate Ranges from 10°/sec. to 1000°/sec.

Some of its specifications:

SIZE:
10, 16 Or 20-23/16 Long

WEIGHT:
3 1/2 Ounces

MOTOR:
25V - 400CPS, 25°

RUN UP TIME:
15 Seconds

PICKOFF OUTPUT:
0.5V - 400CPS

RESOLUTION:
0.004°/sec.

AS. MULT.:
10 to 40 MV

DAMPING:
To suit

SHOCK VIBRATION ENVIRONMENTAL:
Exceeds 400 G RMS MIL-E-8758A specs.

OPER. TEMP. RANGE:
-55° to +55° C

TESTED OPER. LIFE:
1000 hours

Over the past 34 years U.S. Time has produced over 800,000 gyroscopes of various types at rates of up to 17,000 per month.

**Shape of things that come—
from* **TWIN COACH**

Piston or jet...single or multi-engine...trainer...interceptor...turboprop or tanker transport—Twin Coach Aircraft Division is probably unique among America's great subcontractors in its ability to produce major assemblies for many different aircraft types.

That's because we're aircraft specialists. Twin Coach Aircraft

Division's five plants are designed exclusively to produce one of airframe major assemblies. We build no other products...do no other work.

This is important because it means our aircraft assemblies are built by experienced aircraft specialists...are what one can call *in* to produce to specification, on schedule, at the lowest possible cost.

Overall layout, a combustion power source and the rolling machine that can rotate up to 120 or 180 degrees per minute, is just one of many hundreds of modern, high speed machines.

TWIN COACH COMPANY
Aircraft Division

BODY BODIES (TRUCKS • BUSES), COCKPITS AND REAR-END CHASSIS
• PAVES, LEVANS, GROUNDWORKERS • PLATES, ARMED, BODIES

New couplings save Weight/Time

Here is a trouble-free, high pressure, high temperature coupling for bleed air ductwork on jet aircraft. The new Janitrol® line of clamps and flanges permits up to 40% weight savings over conventional designs, and provides dependable, tight connections so matter how many times they are connected or disconnected. There are no loose parts...assembly consists of two flanges and a simple clamp. Seal is metal to metal, with no secondary sealing devices or compounds. Clamp tightens on lifting side.

Quick connects and disconnects can be made by feel alone in hard-to-reach locations. Required lock nut torque is very low. Janitrol® couplings withstand corrosion, temperatures, pressure, surges, misalignment and vibration. Maximum design leakage is .01 cfm per inch of duct diameter, regardless of disconnect frequency, and they're built for continuous use at 250 psf-750 °F. Seven sizes now available, from 1 1/2" to 4". This line of couplings is the most recent outgrowth of Janitrol's long experience in the design and production of clamps and flanges for aircraft heating systems. Send for complete information or phone your nearest Janitrol® representative.

DESTINATION—Everywhere! (to service Bendix-Utica products)

An important consideration in buying precision aviation components and accessories is the kind of service training and equipment that's available to keep these products on the job.

At Bendix-Utica we believe in giving service just as much attention and consideration as we do the products themselves.

That's why we maintain a special service school at Tulsa for advanced training of civil pilots, technical supervisors, and other military and civilian personnel who will be concerned with maintenance of Bendix-Utica products in all parts of the world.

That's why we produce technical service manuals for use wherever our products are in operation . . . why we

make available special test equipment and tools . . . and why we locate our own technical service specialists at strategic spots everywhere.

All of which adds up to another strong reason why . . . in specifying turbine-driven, and other advanced accessories and components . . . it's to your advantage to select Bendix-Utica.

For full details on our service training . . . or on our line of accessory and component products . . . write UTA, A DIVISION, BENDIX AVIATION CORPORATION, 6700 N. YERGEN, NEW YORK.

Anaconda specifies Enjay Butyl rubber

TO DEFY OZONE IN HIGH-VOLTAGE CABLES...

for more current per circuit...more power per dollar

Anaconda specifies Enjay Butyl insulation for high-voltage cables because this rubber has incredible resistance to ozone. Surpassing the industry's standard three-hour specification test, Enjay Butyl insulation used by Anaconda showed no injury after 72 hours of ozone concentration tests—24 times longer than specification requirements. Other rubbers would deteriorate and crack in a fraction of this time.

With the help of Enjay Butyl, millions of feet of Anaconda's cable now in use deliver more current per circuit, more power per dollar.

Perhaps your product, too, can be improved with versatile Enjay Butyl. It comes in non-staining grades for white and light-colored parts, offers excellent electrical properties, low price and immediate availability. For full information, contact the Enjay Company. Complete laboratory facilities and technical assistance are at your service.

Pioneer in Petrochemicals

ENJAY COMPANY, INC., 15 West 51st Street, New York 19, N. Y.

Now FROM SCIAKY...
the most significant development
in the history of resistance welding

AT LAST, **ABSOLUTE ACCURACY** **IN SPECIFICATION WELDING CONTROL**

**The Sciaky Predetermined Electronic Counter Weld Control
 Produces Absolute Weld Consistency and Positive Reproducibility**

To the long line of Sciaky firsts in resistance welding is now added the most important of them all—the Sciaky Predetermined Electronic Counter Weld Control. New resistance welding can easily and economically provide fastness to satisfy your standards of production. . . No matter how rapid they are. . . No matter how long or short your production runs!

THE LOGIC AND SIMPLICITY OF CONCEPT

Without deviation, this new Sciaky control counts the cycles of power line frequency which is governed by the U. S. Naval Observatory. In predetermined absolute numbers the cycles and impulses of the various welder functions are simply counted by a Dekatron tube. A single tube is used to count both the negative cycles of secondary frequency, as well as the impulses of welding current. The positive adjustment snap switch control dials are logically calibrated in these same cycles and impulses.

Close up of a typical welded, plug-in sub-assembly.

ABSOLUTE CONSISTENCY

Control settings are realized with ease. No relays are necessary during the entire welding sequence. The averaging accuracy of counting is maintained throughout the entire range for the longest run at the highest production rate, and is readily reproducible at any time.

Note the ease with which a plug-in unit function can be added.

EASE OF MAINTENANCE OR ADDITION OF FUNCTIONS

The entire control is designed to permit the greatest possible ease and speed in maintenance or addition of functions through the use of separate plug-in sub-assembly units. Down time is minimized since it takes only minutes to install a spare or an additional function.

WRITE FOR DESCRIPTIVE LITERATURE

Further technical, operation and application data is presented in Bulletin No. 228 and No. 229. Write or phone for your copies today. There is no obligation.

Out of thin air

automatic dual radar pressurization

Above 50,000 feet, in the stifled air of the stratosphere, atmospheric pressure is almost nil. But certain components of strategic bombers' navigational and bombing radar need sea-level pressure—others require an even greater pressure. One of them is, literally, they get what they need—from the first completely automatic pressure-fig unit ever developed to provide two pressures for airborne radar plasma—Lear-Bomec's new automatic dual pressurization kit.

Research Policy Needs Revision

President Eisenhower's \$347 million supplementary budget request for more aerospace indicates clearly that his original aerospace budget submitted in January was inadequate. The character of the funds requested in the supplemental also indicates that the Defense Department and the White House do not yet understand the fundamental nature of the technological race with Russia for aerospace supremacy and, consequently, have not yet acted to develop and support a sound aeronautical, military research program. The President has asked for \$247 million more to increase production of the Boeing B-52 heavy jet bomber, \$120 million more to extend the outstanding net on both F-4s of the North American continental and about \$50 million more for scientific research. These are all programs vital to our future defense.

The only quarrel with this supplement might be that it is much too little, much too late.

However, the most serious defect in the President's belated effort to bolster his aerospace budget is the lack of any fundamental change in the basis for aeronautical research and development. The fundamental flaw in the aeronautical research policy as defined by the top-level Department of Defense officials and the White House in the face of almost unanimous opposition from civil and military experts is the fact that new orders grow during the next few years and they underestimate the entire state of our military aerospace. For research and development are the foundations on which the aerospace of the future is always built. Without a sound research foundation, it is impossible to build superior aerospace.

Principal Flaws

What are the principal flaws in our present aeronautical research-and-development policy? They occur in three broad areas—manpower, management and security.

Defense Secretary Wilson and his cohorts on the second floor B Ring of the Pentagon are proud of their "aerospace budget level" research and development policy that maintains this vital effort at about the same budget level year after year. They honestly believe that it is sound policy that will keep us ahead of the Russian technological surge. Nothing could be further from the truth. Nothing could create better direct fundamental ignorance of the basic research and development problem.

Lt. Gen. Thomas Power, Chief of the Air Research and Development Command, sounded a clear warning in this problem before the Aviation Writers Association in Washington recently when he emphasized that the rapidly increasing rate of technical progress combined with increasing complexity of equipment required a constant increasing scale of research effort to achieve a constant level of progress. He said: "This means that one year's budget for research and development cannot be an equal amount during the following years or there will. Therefore, research and development appropriations must be matched to the expanding requirements of technological progress."

"Unless we can see our way clear to do this we will lose our technological superiority to the less budget-hungry Russians."

The constant budget-level research and development policy, now pushed by the Defense Department and the White House will virtually guarantee our loss of technological supremacy to the Russians during the next five years unless it is drastically revised immediately.

Security Hobbles

In addition to the fundamental handicap of inadequate funds, one scientific engineering team is further hindered by excessive and, for the most part, senseless military security restrictions. Scientific progress thrives, and advances rapidly only in an atmosphere of fast and widespread interchange of information. The compartmentalized scientific effort that stems from the wartime Manhattan Project and the "need to know" policy of current military security is slowing the pace of American technological progress without hampering any competing progress. In addition, basically an American policy, and procedures in military security clearance operations has discouraged too many scientists from participating in the military research program. A recent survey at Johns Hopkins in a graduate class in a university disclosed that more than half of them were not interested in participating in military research programs because of the time-consuming security procedures that can involve either blinding a scientist's character without a shred of legal evidence.

Ten years before the Moss Subcommittee in the House of Representatives disclosed that major universities such as Massachusetts Institute of Technology, Harvard, Stanford and Chicago have refused government research contracts because of excessive security restrictions.

Excessive and blundering military security is restricting the free flow of vital technical information throughout the engineering, scientific, industry, complex and is discouraging young scientists and engineers from entering the military research program.

This discouragement comes at a time when the scientific manpower being used in the military research program has reached a critical point. One Defense Department estimate for not increasing the research budget is that all the military scientific and engineering manpower is already being used in the military program and more money would not solve this critical manpower problem. This thesis quickly collapses on analysis which indicates that about 10% of the scientific talent in this country is now being utilized on aeronautical and related research instead of the 30% that has been so glibly quoted in recent months.

The research-and-development problem is more complex and less easily dramatized than production of new weapons. But unless a few more solutions are invented in a sound research and development program that will enable American science and industry to fully explore the new technological frontiers that are now visible, all of the billions invested in production of aerial weapons will be wasted and we will face the future with second best weapons.

—Robert Hottel

FAFNIR BUILDS PLANT NO. 6

New five-acre plant at
Newington, Connecticut will streamline
machining and heat treating operations

Fafnir Plant No. 6, now nearing completion, will house the most modern machining and heat treating equipment and will provide for convenient storage and handling of steel.

The opening of this large plant represents an increase in floor area of about 30% and an important step in a long-range program to speed production of over 10,000 types and sizes of Fafnir ball bearings and ball bearing units. The plant occupies one corner of a hundred-acre site which will make possible a four-fold expansion.

Fafnir's 18 strategically-located branch warehouses and its coast-to-coast network of authorized distributors will soon reflect the added productive capacity which this new facility makes possible.

The Fafnir Bearing Company,
New Britain, Connecticut.

WHO'S WHERE

In the Front Office

Victor Carlier, former Assistant Secretary of U. S. Air Force, has been named assistant director of Arms Manufacturing Co., Franklin, Conn.

L. A. Knepper, president, Conductive Anode Corp., Akron, Ohio, succeeds **P. W. Littlefield**, who continues as a board chairman and as an advisory expert.

Richard Hodgson, executive vice president, Traveler-Cummins & Industrial Corp., Dayton, N. Y., succeeds **John M. Galt**, resigned.

Walter F. Miller, vice president-general manager, Springfield (Vero), Division American Bosch, New City, Garden City, N. Y., also **Harold R. Swanson**, vice president-engineering and Kenneth F. Tenison, vice president manufacturing and technical control manager.

William E. Harris, managing director Continental Motors of Canada Ltd., St. Thomas, Ont., relinquishes all Continental Motors Corp., Weybridge, Mass.

Lee Rosinsky, vice president California Aviation Service, Inc., Oakland, Calif., resigns as director.

E. S. Jackson, Director General, Avroco Wagon, British Columbia, of Seattle, has ending 14, Gen. Sir Frederick Mangin, Commander of Western Forces.

Howard F. Hall, vice president-operations and general counsel, Hughes Aircraft Co., Culver City, Calif., also **William W. Washburn**, vice president-administration **John D. Richardson**, director sales and **Ron E. Wenshild**, manager of Tucson, Ariz., operations.

Honors and Elections

U. S. Air Force, Air Defense Command has been named for the Distinguished Trophy for 1974, given the USAF command those over 100,000 in monthly that achieve the lowest accident record in the preceding calendar year. Air Defense Command set its major accident rate, all aircraft, by 57% and for jet fighter aircraft by 18%.

Capt. Edward V. Rottschaefer, head chairman, Eastern Air Lines, has been appointed to the National Advisory Committee for Aeronautics as President Eisenhower to sit the issue of his, Ralph Dornan.

Dr. Robert W. Boyle, senior research staff, Johns Hopkins University, Silver Spring, Md., has been named first recipient of a Johns Hopkins Fellowship for professional staff members. He will do research on "nuclear materials."

Changes

Donald K. Marsh, sales manager, Adel Process Products, Division of General Motors Corp., Detroit, Mich.

Edmund V. Lattin, chief of Control Systems Research Division, Rema Washburn Corp., Los Angeles, Calif.

Robert W. Marshland, manufacturing director, Great Industries, Inc., Jamaica, N. Y.

INDUSTRY OBSERVER

► General Electric J79 engine which powers the production Lockheed F-106 is in a final design stage. Computer experience with this engine and its thrust on J73, coupled with increased responsiveness expected for J79, led to the decision.

► DICOM (Detection of Intercontinental Ballistic Missiles) project phase contract has been awarded to Walburn Laboratories, Electronic Systems Division of Systems Control, renamed by Rome Air Development Center, will cover such the detection phase. Walburn Laboratories also has prime contract with Army Ordnance in development of complete anti-aircraft system, including the detection equipment and the weapons.

► Last out of first 11 Constellation II-55 Mod 10000 systems will have all-terrain electronic countermeasures equipment developed by Walburn Laboratories.

► Designation for Boeing's nuclear-powered bomber, once abandoned in favor of the chronically failed project 110, was project 125.

► Another example of Russian retelling of American photographs has been published in a recent Czech magazine. It purported to be a picture from one of the latest Russian intelligence failures. Investigation showed the picture had been retouched from one appearing in a United Nations annual report. Major changes consisted of removing warblers' motion and applying their white shirts with "green" smocks.

► North American's F-100F will be a two place version of supersonic day operations fighter. Place will have, as do other two-place version of Century Series fighters, both cockpit and training positions.

► Lear Inc. has the contract for the most stable augmentation for Lockheed's F-104. Success of stabilization is apparent from photo comments that F-104 prototype has reached Mach 1.5 without air indication of stability problems with such a radical change in design and structure.

► The aerial photo reconnaissance version of the Convair aerospace RB-58 Hustler incorporates a closed circuit television view finder and a fully automatic control system for pulse and range motion control camera (AW News 21, p. 14). Fairchild Camera and Instrument Corp., subcontractor, has reduced the original weight of 1,384 lb. for entire system to 794 lb.

► Votco Corp. will receive a Office of Naval Research contract to develop a VTOL project for the U. S. Army.

► USAF's Air Materiel Command has awarded contracts totaling \$1,142,200 to five firms for "facilities in support of" Convair's Atlas intercontinental ballistic missile. The firms and the dollar amounts: Sperry Rand, \$155,400; Avco Manufacturing Corp., \$1,425,000; Rema Washburn Corp., \$400,000; Western Electric, \$500,000; General Electric, \$851,300.

► North American Aviation Inc. has received an additional \$5,125,000 contract to aid from the Air Materiel Command for further development of its Navaho intercontinental missile.

► USAF's Cranbury (Mass.) Research Center has initiated a research program to study means for the suppression of controls on high-altitude missions over enemy territory.

► Rome Air Development Center has developed a new optical plating device known as "MINK" to speed the design and identification of sub-detected aircraft. Radar Map appearing on a cathode ray tube are optically transferred onto a high plating surface which, in turn, is optically etched onto a large screen where it can be viewed by a number of persons.

the application of

INERTIAL NAVIGATION

After years of experience in the application of inertial navigation, Fairchild Guided Missiles Division is now participating in the development of many new systems of this type.

The particular direction being taken by our talented engineering and scientific staff is of course secret, but the importance of inertial guidance to America's defense is not. The missile that incorporates true inertial guidance is virtually undetectable, because it is totally self-contained, depending only upon its own "brain" to pinpoint its target.

Developing such projects as these demands the greatest knowledge, experience and inventiveness. You'll find them all at Fairchild Guided Missiles Division, currently being applied as well to many other new, advanced concepts in this vital field of defense.

... WHERE THE FUTURE IS MEASURED IN LIGHT YEARS

Washington Roundup

Fare Review Coming

Prospects for an investigation of domestic passenger fares by the Civil Aeronautics Board grew brighter as the tide of congressional pressure for an investigation rises. The latest pooling came from the House Appropriations Committee Subcommittee which approved the CAB budget. Committee members suggested that Congress might direct the Board to launch an investigation if it didn't go ahead on its own.

A key factor in congressional discontent is the fact that the CAB hasn't set a standard rate of return and other relative regulation guidelines in a specific period, applying to passenger fare levels. Congressmen applying for an investigation want the Board to apply other regulating techniques used in other fields to the airlines.

The pressure from the House subcommittee came on the heels of a Government Accounting Office report indicating that the Board's investment program for the Forber, Ray, Emanuel, Collier (F.R.E.C.), chairman of the House Anti-Monopoly Subcommittee, criticized the CAB for never having conducted such an investigation. All this agitation makes it more and more difficult for the CAB to avoid a general fare investigation.

Renegotiation Renewal

Lack of time and the strong opposition of small businesses indicate that the Renegotiation Act due to expire Dec. 31 will not be renewed by Congress before adjournment for the political convulsions. The Joint Congressional Renegotiation Committee is now making a study to determine whether or not it should be.

Aircraft Industries Association is opposed to the new act, which takes the position that the act is "unnecessary." But it is wrong. AIA's opposition, the policy should be clear that "a general criterion of the government is to encourage the attainment of a strong, stable defense industry with proper incentives to more progress and efficiency. The Renegotiation Board should give due weight to the importance to the defense program of preserving and increasing the defense industry in tandem with the research and development and health, replacement and expansion programs which are essential for the defense job."

National Security Industries Association has taken a similar position. "This is a real question whether overall profit control is required at all in our area so our present percentage control. But whatever may be the answer to that question, it is clear that a profit control has little the present Renegotiation Act, which ignores traditional concepts of fair dealing and due process, cannot be justified on any basis. It should be repealed."

IATA Fare Plan

A third-class transatlantic service rate, he offered to the International Air Transport Association by the U.S. airlines is a solution for the IATA fare problem. IATA will hold a traffic conference starting at Geneva, France, at the end of May to try to find solutions to the problems raised by the Civil Aeronautics Board when it sharply criticized IATA's fare proposals for hard service and refused to approve the fares just September 30.

Per American World Airlines is supposed working on

a plan for a service with higher density seating that would lower service, on four meals and less about 25% lower than regular tourist fares. The service would be more like domestic aircraft service than current overseas tourist service and would lower the Atlantic as service with a choice of three classes of travel.

The foreign airlines aren't likely to shirk much of such a plan. Scandinavian Airlines System, for instance, faces an overbook loss with a 17-25-day time limit and a 30% fare reduction. SAS figures such a sale has would be a new market and smooth out seasonal traffic imbalances.

Minetti Action

Over the protest of Sen. Mike Mansfield (D-Mont.), chairman of the Senate Subcommittee, Senate Commerce Committee has scheduled a hearing May 18 on the nomination of G. Joseph Minetti to the Civil Aeronautics Board and Charles J. Linton to administration of the Civil Aeronautics Administration. Minetti wanted action on his legislation separating Civil Aeronautics Administration from Commerce Department before nomination of the nomination of either Minetti or Linton—both scheduled Jan. 9. Minetti's appointment that has been on the independent CAA bill will not be completed until one week. He has reached the legislation after the firing of former CAA Administrator Fred B. Lee.

Job Description

The long-standing ink of the Assistant Secretary of Defense for Acquisition Engineering still is being wiped from their desks after the job was vacated. The office will be headed by Norman D. Newberry, retired independent of Westinghouse Electric Corp., and has a mission "to guide the military services in the management and accomplishment of their total procurement responsibilities."

New Defense Department Instruction No. 332.4, April 2, 1956, sets objectives as "to ensure that aerial systems and repair parts (including optical tools, test equipment and support equipment) required to support and maintain each item of material being introduced into service will be available. Army, Navy and Air Force, on given 60 days to review system programs and take action, 120 to full Northrup report new regulations they have instituted.

Bilateral Air Agreements

Legislation making airline industry participation condition in negotiation for all international bilateral air agreements was he expected at the Senate of Congress. Senate Commerce Committee has decided unanimously to push it. The move was touched off by the U.S.-German bilateral. After hearings and investigation, a subcommittee headed by Sen. George Smathers (D-Fla.) issued a report which said that because of the inadequacies of the agreement resulted from "failure of the government to conduct with and to allow sufficient participation by representatives of the airline industry. It is important that our government and itself of the expert assistance within the air transport industry."

—Washington Staff

F. B. Henschler Dies

Frederick Burt Henschler, board chairman of United Aircraft Corp., died April 25 of his stroke illness at his home, Fla. He was 88 years old.

One of the power leaders in the growth of U. S. aviation, Henschler began his career in World War I and helped to start Wright Aeronautical Corp. in 1916, becoming president of the firm shortly after its founding. He died in 1924 by the Wright and in August 1924 founded Pratt & Whitney Aircraft Co. with a handful of associates.

The small group quickly developed and built the first Wright military radial air engine, which was exhibited in 1915 as one of the world's leading air engines.

Later in 1918, he helped organize United Aircraft & Transport Corp., which became the present United Aircraft Corp. in 1924.

Senate Group Finds Demon 'Total Loss'

Washington—The Senate Preparedness Subcommittee's 11-week, repeated allegations over the role of the Navy in the IIRN (Intercontinental Reconnaissance Network) aircraft introduction of replacement needed procurement plan is a report, stating: "If the \$320 million IIRN aircraft program (AW Oct 10 p. 16)

as a total loss 'except for the lessons learned'.

Two other congressional groups—the House Military Operations Subcommittee, headed by Rep. Carl Albert (D-Calif.) and the House Military Appropriations Subcommittee, headed by Rep. George Mahon (D-Ill.)—should have completed investigations of the IIRN, built by McDonnell Aircraft Co., and purchased by a Washington, D.C., agency.

Pointing out that the Navy's decision to proceed with IIRN aircraft before air engine had been developed was made during the stress of the Korean emergency, the Senate Subcommittee, headed by Sen. Lyndon Johnson (D-Tex.) recommended:

"That it did not wait, not act as a harbinger, but the Navy must not be misled by the decision."

On the other hand, he did not think, in his view, for the failure of the program may be lost at the door of either procurement practice.

If IIRN were in effect in 1951, the cost would probably have been no different since engines to spin, engines used in IIRN as well as other air engine plan. Insurance in IIRN are various conditions in comparing the loss. For one might reasonably have realized in 1951 that the possible advantage of success but speculation would have been less.

The subcommittee directed the

Martin Co. Wins Phase I Bomber Competition

The Martin Co. has won the Phase I preliminary weapons system competition for a segment tactical bomber for the USAF. A development contract is to be awarded this week.

The project in Martin will be the first under the Phase I concept outlined by the Joint Chiefs of Staff (JCS) in 1951. Contracts are needed to award a development to design weapons systems and conduct studies for evaluation.

Martin's proposal for the tactical bomber weapons system was selected over that of Douglas Aircraft Co., one of Martin's designs are capable of zero length landing.

Other Phase I contracts were awarded to North American Aviation, Northrop Aircraft and Republic Aviation for a long-range interceptor, and to North American and Republic Aviation for a fighter-bomber. North American Aviation has won the long-range intercept competition (AW Oct 26 p. 21).

Navy, to make possible progress, together with it in the results of the IIRN plan. It also directed the Air Force to make plans for its procurement policies under the similar Cork-Cage Plus. The results of this procurement procedure have not yet been established, the subcommittee added.

Services Standardize Search and Rescue

Washington—The first official manual governing aerial emergency procedures over water for both civil and military aircraft will be distributed this week by the U. S. Coast Guard.

Complied with the activities of the Navy and the Civil Aeronautics Administration and bearing the additional endorsement of the USAF, the 115-page manual outlines and standardizes emergency search and rescue procedures for the Air Force, Navy, Coast Guard and U. S. civil agencies in various flights.

The manual, independent of but directly related to the Air Commanding General's recent publication of national search and rescue plan (AW April 16, p. 182), bears the endorsement of U. S. Coast Guard Commandant A. C. Richmond, Adm. Arthur A. Burke, Chief of Naval Operations, and Gen. Nathan F. Twining, USAF Chief of Staff.

Distress Procedures

Specifically, the manual outlines the proper distress procedures to be followed in the event of an emergency situation and outlines and outlines rescue, craft, and makes note of search suggestions as to the best way to detect a crippled aircraft at sea. It also bears the heading:

"Because of the many variables in aircraft emergencies and SAR operations, it is impracticable to cover every possible contingency which may arise. Likewise, it is undesirable to set forth procedures and techniques which are so detailed and rigid that on-the-spot flexibility is sacrificed. Hence, many of the procedures and techniques are stated herein should be tempered with judgment and due regard for unusual conditions existing at the time."

For a pilot in actual distress, the manual outlined "Aircraft Emergency Procedures Over Water," bears these instructions:

- Turn on emergency IF
- Transmit three times "SOS" on MCW if available or CW and/or "MAYDAY" as once followed by an own identification repeated three times.

- Transmit an aerial distress signal.
- If the channel fails, use any of the following channels: 121.5 MHz, 241 MHz, 100 MHz, 118.2 MHz, 119.1 MHz, 123.0 MHz, 123.5 MHz, 124.0 MHz, 124.5 MHz, 125.0 MHz, 125.5 MHz, 126.0 MHz, 126.5 MHz, 127.0 MHz, 127.5 MHz, 128.0 MHz, 128.5 MHz, 129.0 MHz, 129.5 MHz, 130.0 MHz, 130.5 MHz, 131.0 MHz, 131.5 MHz, 132.0 MHz, 132.5 MHz, 133.0 MHz, 133.5 MHz, 134.0 MHz, 134.5 MHz, 135.0 MHz, 135.5 MHz, 136.0 MHz, 136.5 MHz, 137.0 MHz, 137.5 MHz, 138.0 MHz, 138.5 MHz, 139.0 MHz, 139.5 MHz, 140.0 MHz, 140.5 MHz, 141.0 MHz, 141.5 MHz, 142.0 MHz, 142.5 MHz, 143.0 MHz, 143.5 MHz, 144.0 MHz, 144.5 MHz, 145.0 MHz, 145.5 MHz, 146.0 MHz, 146.5 MHz, 147.0 MHz, 147.5 MHz, 148.0 MHz, 148.5 MHz, 149.0 MHz, 149.5 MHz, 150.0 MHz, 150.5 MHz, 151.0 MHz, 151.5 MHz, 152.0 MHz, 152.5 MHz, 153.0 MHz, 153.5 MHz, 154.0 MHz, 154.5 MHz, 155.0 MHz, 155.5 MHz, 156.0 MHz, 156.5 MHz, 157.0 MHz, 157.5 MHz, 158.0 MHz, 158.5 MHz, 159.0 MHz, 159.5 MHz, 160.0 MHz, 160.5 MHz, 161.0 MHz, 161.5 MHz, 162.0 MHz, 162.5 MHz, 163.0 MHz, 163.5 MHz, 164.0 MHz, 164.5 MHz, 165.0 MHz, 165.5 MHz, 166.0 MHz, 166.5 MHz, 167.0 MHz, 167.5 MHz, 168.0 MHz, 168.5 MHz, 169.0 MHz, 169.5 MHz, 170.0 MHz, 170.5 MHz, 171.0 MHz, 171.5 MHz, 172.0 MHz, 172.5 MHz, 173.0 MHz, 173.5 MHz, 174.0 MHz, 174.5 MHz, 175.0 MHz, 175.5 MHz, 176.0 MHz, 176.5 MHz, 177.0 MHz, 177.5 MHz, 178.0 MHz, 178.5 MHz, 179.0 MHz, 179.5 MHz, 180.0 MHz, 180.5 MHz, 181.0 MHz, 181.5 MHz, 182.0 MHz, 182.5 MHz, 183.0 MHz, 183.5 MHz, 184.0 MHz, 184.5 MHz, 185.0 MHz, 185.5 MHz, 186.0 MHz, 186.5 MHz, 187.0 MHz, 187.5 MHz, 188.0 MHz, 188.5 MHz, 189.0 MHz, 189.5 MHz, 190.0 MHz, 190.5 MHz, 191.0 MHz, 191.5 MHz, 192.0 MHz, 192.5 MHz, 193.0 MHz, 193.5 MHz, 194.0 MHz, 194.5 MHz, 195.0 MHz, 195.5 MHz, 196.0 MHz, 196.5 MHz, 197.0 MHz, 197.5 MHz, 198.0 MHz, 198.5 MHz, 199.0 MHz, 199.5 MHz, 200.0 MHz, 200.5 MHz, 201.0 MHz, 201.5 MHz, 202.0 MHz, 202.5 MHz, 203.0 MHz, 203.5 MHz, 204.0 MHz, 204.5 MHz, 205.0 MHz, 205.5 MHz, 206.0 MHz, 206.5 MHz, 207.0 MHz, 207.5 MHz, 208.0 MHz, 208.5 MHz, 209.0 MHz, 209.5 MHz, 210.0 MHz, 210.5 MHz, 211.0 MHz, 211.5 MHz, 212.0 MHz, 212.5 MHz, 213.0 MHz, 213.5 MHz, 214.0 MHz, 214.5 MHz, 215.0 MHz, 215.5 MHz, 216.0 MHz, 216.5 MHz, 217.0 MHz, 217.5 MHz, 218.0 MHz, 218.5 MHz, 219.0 MHz, 219.5 MHz, 220.0 MHz, 220.5 MHz, 221.0 MHz, 221.5 MHz, 222.0 MHz, 222.5 MHz, 223.0 MHz, 223.5 MHz, 224.0 MHz, 224.5 MHz, 225.0 MHz, 225.5 MHz, 226.0 MHz, 226.5 MHz, 227.0 MHz, 227.5 MHz, 228.0 MHz, 228.5 MHz, 229.0 MHz, 229.5 MHz, 230.0 MHz, 230.5 MHz, 231.0 MHz, 231.5 MHz, 232.0 MHz, 232.5 MHz, 233.0 MHz, 233.5 MHz, 234.0 MHz, 234.5 MHz, 235.0 MHz, 235.5 MHz, 236.0 MHz, 236.5 MHz, 237.0 MHz, 237.5 MHz, 238.0 MHz, 238.5 MHz, 239.0 MHz, 239.5 MHz, 240.0 MHz, 240.5 MHz, 241.0 MHz, 241.5 MHz, 242.0 MHz, 242.5 MHz, 243.0 MHz, 243.5 MHz, 244.0 MHz, 244.5 MHz, 245.0 MHz, 245.5 MHz, 246.0 MHz, 246.5 MHz, 247.0 MHz, 247.5 MHz, 248.0 MHz, 248.5 MHz, 249.0 MHz, 249.5 MHz, 250.0 MHz, 250.5 MHz, 251.0 MHz, 251.5 MHz, 252.0 MHz, 252.5 MHz, 253.0 MHz, 253.5 MHz, 254.0 MHz, 254.5 MHz, 255.0 MHz, 255.5 MHz, 256.0 MHz, 256.5 MHz, 257.0 MHz, 257.5 MHz, 258.0 MHz, 258.5 MHz, 259.0 MHz, 259.5 MHz, 260.0 MHz, 260.5 MHz, 261.0 MHz, 261.5 MHz, 262.0 MHz, 262.5 MHz, 263.0 MHz, 263.5 MHz, 264.0 MHz, 264.5 MHz, 265.0 MHz, 265.5 MHz, 266.0 MHz, 266.5 MHz, 267.0 MHz, 267.5 MHz, 268.0 MHz, 268.5 MHz, 269.0 MHz, 269.5 MHz, 270.0 MHz, 270.5 MHz, 271.0 MHz, 271.5 MHz, 272.0 MHz, 272.5 MHz, 273.0 MHz, 273.5 MHz, 274.0 MHz, 274.5 MHz, 275.0 MHz, 275.5 MHz, 276.0 MHz, 276.5 MHz, 277.0 MHz, 277.5 MHz, 278.0 MHz, 278.5 MHz, 279.0 MHz, 279.5 MHz, 280.0 MHz, 280.5 MHz, 281.0 MHz, 281.5 MHz, 282.0 MHz, 282.5 MHz, 283.0 MHz, 283.5 MHz, 284.0 MHz, 284.5 MHz, 285.0 MHz, 285.5 MHz, 286.0 MHz, 286.5 MHz, 287.0 MHz, 287.5 MHz, 288.0 MHz, 288.5 MHz, 289.0 MHz, 289.5 MHz, 290.0 MHz, 290.5 MHz, 291.0 MHz, 291.5 MHz, 292.0 MHz, 292.5 MHz, 293.0 MHz, 293.5 MHz, 294.0 MHz, 294.5 MHz, 295.0 MHz, 295.5 MHz, 296.0 MHz, 296.5 MHz, 297.0 MHz, 297.5 MHz, 298.0 MHz, 298.5 MHz, 299.0 MHz, 299.5 MHz, 300.0 MHz, 300.5 MHz, 301.0 MHz, 301.5 MHz, 302.0 MHz, 302.5 MHz, 303.0 MHz, 303.5 MHz, 304.0 MHz, 304.5 MHz, 305.0 MHz, 305.5 MHz, 306.0 MHz, 306.5 MHz, 307.0 MHz, 307.5 MHz, 308.0 MHz, 308.5 MHz, 309.0 MHz, 309.5 MHz, 310.0 MHz, 310.5 MHz, 311.0 MHz, 311.5 MHz, 312.0 MHz, 312.5 MHz, 313.0 MHz, 313.5 MHz, 314.0 MHz, 314.5 MHz, 315.0 MHz, 315.5 MHz, 316.0 MHz, 316.5 MHz, 317.0 MHz, 317.5 MHz, 318.0 MHz, 318.5 MHz, 319.0 MHz, 319.5 MHz, 320.0 MHz, 320.5 MHz, 321.0 MHz, 321.5 MHz, 322.0 MHz, 322.5 MHz, 323.0 MHz, 323.5 MHz, 324.0 MHz, 324.5 MHz, 325.0 MHz, 325.5 MHz, 326.0 MHz, 326.5 MHz, 327.0 MHz, 327.5 MHz, 328.0 MHz, 328.5 MHz, 329.0 MHz, 329.5 MHz, 330.0 MHz, 330.5 MHz, 331.0 MHz, 331.5 MHz, 332.0 MHz, 332.5 MHz, 333.0 MHz, 333.5 MHz, 334.0 MHz, 334.5 MHz, 335.0 MHz, 335.5 MHz, 336.0 MHz, 336.5 MHz, 337.0 MHz, 337.5 MHz, 338.0 MHz, 338.5 MHz, 339.0 MHz, 339.5 MHz, 340.0 MHz, 340.5 MHz, 341.0 MHz, 341.5 MHz, 342.0 MHz, 342.5 MHz, 343.0 MHz, 343.5 MHz, 344.0 MHz, 344.5 MHz, 345.0 MHz, 345.5 MHz, 346.0 MHz, 346.5 MHz, 347.0 MHz, 347.5 MHz, 348.0 MHz, 348.5 MHz, 349.0 MHz, 349.5 MHz, 350.0 MHz, 350.5 MHz, 351.0 MHz, 351.5 MHz, 352.0 MHz, 352.5 MHz, 353.0 MHz, 353.5 MHz, 354.0 MHz, 354.5 MHz, 355.0 MHz, 355.5 MHz, 356.0 MHz, 356.5 MHz, 357.0 MHz, 357.5 MHz, 358.0 MHz, 358.5 MHz, 359.0 MHz, 359.5 MHz, 360.0 MHz, 360.5 MHz, 361.0 MHz, 361.5 MHz, 362.0 MHz, 362.5 MHz, 363.0 MHz, 363.5 MHz, 364.0 MHz, 364.5 MHz, 365.0 MHz, 365.5 MHz, 366.0 MHz, 366.5 MHz, 367.0 MHz, 367.5 MHz, 368.0 MHz, 368.5 MHz, 369.0 MHz, 369.5 MHz, 739.0 MHz, 739.5 MHz, 740.0 MHz, 740.5 MHz, 741.0 MHz, 741.5 MHz, 742.0 MHz, 742.5 MHz, 743.0 MHz, 743.5 MHz, 744

the greatest component of wind on the nose of the aircraft.

The priority job is essentially to set the aircraft down on a proper heading in the right spot at the best combination of attitude and speed. Once first impact has been made, there's not a lot to be done to control a landing in a rougher, however, the pilot remains responsible since he normally can control the plane through the aircraft.

Since an emergency may arise at any time, the SAR manual outlines procedures for a number of conditions, including use of procedures for ditching under night and instrument conditions. Other conditions considered are natural escort, with escort and with low visibility and cutting.

From sea going, it is available to its rescue aircraft and highly recommended by the Coast Guard as the Ocean Station Vessel and the merchant vessel. The OSV can be relied on to effect a rescue, assist in the aircraft's ditching and rescue survivors.

SAR Intercept

Another important element of search and rescue operations is that of intercept and escort of distressed aircraft. The SAR manual describes a full chapter to have intercept and escort procedures. Once an intercept is made, the escort usually can provide such services as navigation, communications and ditching assistance.

Small chapters of the manual are devoted to preparation for ditching, survival, first aid and emergency checklist.

The difficult tasks that must be performed at the critical time of a flight emergency are and should be reduced as far as practicable, the Coast Guard says.

The manual urges vigorous attention to the annual or personal improvement of the time the aircraft is maintained in the design of survival equipment, the development of tactics and other group procedures, and extensive and repeated flight crew training in ditching and ditching drills. The Coast Guard feels the activities in preparing a SAR manual because of its statutory responsibility for developing, establishing, maintaining and operating rescue facilities for the preservation of life on the water with the members of the Armed Forces is available because this provides search and rescue facilities in support of their own operations and makes them able to meet civil needs.

Copies of the manual, which costs \$2.25, can be ordered from the Superintendent of Documents, U. S. Government Printing Office, Washington 25, D. C.

News Digest

General Electric T38 turbine of 1,000 shp will be shown publicly for the first time during NACA's annual forum at American Helicopter Society in Washington, D. C. Nov. 2-5.

First HH-28 Sikouk transport helicopter accepted for delivery to the Navy was flown non-stop from the Bridgeport Coast Center, Elizabeth River Md., carrying its equivalent payload in excess of military requirement. The helicopter, with an average ground speed of 101 mph, completed the 236-mile flight in two hours, 41 minutes.

Fairchild J44 helicopter received a Civil Aeronautics Administration type certificate, making the 1,000 lb thrust powerplant available for use in civil aircraft. Fairchild has built more than 900 J44s; annual quantity production began in 1958.

Liquid-propellant rocket engine 8-115 is being built in Aerojet-General

Corp at Azusa, Mo. USAF awarded the firm a \$9.5 million contract for the new facility, scheduled for completion late this year.

Negotiations are being completed by Thudell Chemical Corp., Titusville, N. J. for purchase of 10,000 acres for location of a synthetic rubber plant and waste plant and test center near Corvallis, Utah. New plant will employ 400-500 persons initially.

Research and development volume of nearly \$14 million for FY 1958 is forecast by General Aeronautical Laboratories, Inc., Bedford, N. Y., anticipating an increase in excess of \$1.5 million over the preceding fiscal year. The laboratory's backlog as of May 31, 1957 is \$11.25 million, a decrease of \$4.75 million from the same date last year.

Two Vickers Viscount 700Ds have been ordered by Philippine Air Lines for use on non-scheduled mail routes and Manila-Hong Kong service. PAL's contract lists total Viscounts delivered or ordered to 504. The 770D has Rolls Royce Dart RDs 4 MR 580 engines.

Military Aviation Funds

The three military services had an unobligated balance of \$12.7 billion on hand as of March 1 for contract letting for aircraft, engines, parts, guided missiles and electronic equipment. The unobligated balance was over \$22 billion.

	OBLIGATIONS (\$000 Omitted)		EXPENDITURES (\$000 Omitted)

*"Speak softly
and carry a big stick"*

Theodore Roosevelt

Rheem

GOVERNMENT PRODUCTS DIVISION

In December 1957, the "Great White Fleet," consisting of seven fully armed battleships, set sail from Hampton Roads, Virginia. Its purpose—to quell the rumors that was mounting in the Far East by creating visible evidence of United States power. This was Teddy Roosevelt's "big stick!"

Today, we are not without the need for a big stick of our own, and Rheem, as a major producer of quality government products, is proud of its contribution to the filling of this vital need. You can rely on Rheem for quality, for low pre- and post-sale, and for on-time delivery. The second quality for itself—and eloquently.

Rheem's Government Products Division are primarily in quality development and production on air frames, missile and jet engine components, airborne ordnance, electronics and ordnance material.

AIR TRANSPORT

Airline Pattern Set During Rizley Tenure

Bade outlines for airline future were decided upon during Rizley's one-year CAB chairmanship.

By Craig Lewis

Washington—The past year became a dramatic period for the nation's airlines when two basic patterns in the industry's future took shape. In a first month period at the end of 1955, the airlines decided what they regarded would be in the coming year and the Civil Aeronautics Board decided how the airlines will compete with each other for the growing air travel market.

The airline's future and their success with their new equipment depends to a large degree upon the success of the major work of the transportation pattern accomplished by the CAB last year.

A key factor in this revision of the pattern of competition was that the CAB during the past year and now returned to his more traditional role as a federal judge.

Rizley Set Pattern

Rizley's term on the Board is the last of the new pattern in two years. His presiding over the Board's decision on the issue of three major airline cases and the long-standing Large Irregular Case and brought them to a vote before the end of 1955. The decisions and action on reconsideration petitions were completed on all four cases and as the vote ended and in one member of the 1955 Board Jack Lee, left the CAB.

Chairman Rizley's role on the case in the other two years was in the deciding vote on an extra limited Federal Board. When the Board split on the particulars of applying its new competition philosophy, Rizley teamed with Jack Lee and Vice Chairman Joseph F. Adams in favor of more competition.

Actually, members Glen Gurnee and Herman D. Brown went along with the Board on most of the vote cases although they chose to dissent in some of the matters in the Denver Service Case and the Northeast/Southwest Case. The most vocal dissenter of opinion came when the three member majority voted to allow the new constitution Supplemental Air Carrier to operate 10 flights a month in scheduled service.

This decision in the Large Irregular Case has brought strong and better criticism of the Board from the airline and other industry and most of the

criticism has been aimed at Rizley. The general fact that CAB appoints such low airline background has been particularly applied to Rizley and he has been criticized for taking the job in CAB chairman when he expected to leave the Board before his term was up.

Public Consideration

In the last of the criticism, Rizley was his record at the CAB with no airline case. The former chairman told Aviation Week during an interview last week that the CAB has no right to the new policy, moved from Congress to better protection of the Board's own philosophy.

Rizley said during the traveling public was a primary consideration in the decisions of the Board made. He said the public is getting more and better service at lower rates than ever before. The smaller travel airlines also such as scheduled carriers during the last according to Rizley. He thinks the major airline decisions will help the smaller lines without disrupting the business carrier.

NYA Adds Bell 47H for Charters

Thus far Bell 47H has been added to New York Airways helicopter fleet to handle charter operations that are recommended for the industry identity 4-55. NYA also used the 47H for carrying baggage pilots.

The true purpose of improving service to the public and strengthening the position of the smaller regional carrier were prominent themes in the reports, opinions in the New York, Chicago Case, the Denver Service Case and the Northeast/Southwest Service Case.

The Large Irregular decision also cited improvement of service to the public as a basis for the authority it granted.

Rizley held the general trends which continued in airline moves for the first quarter of 1956 show that the CAB was right in its judgment last fall. He also points to the favorable reaction to the new policy, moved from Congress to better protection of the Board's own philosophy.

President in Pleaded

President Eisenhower is reportedly highly satisfied with Rizley's record with the CAB and pleased with the accomplishments of the Board in a whole over the past year.

Referring to Rizley that he and other Board members have come to the CAB without any airline background, Rizley concludes that airline experience would be helpful to a CAB member. But he feels that, since the Board is a

GOOD WAY TO START A FINISHED PRODUCT

CALL ON ROHR FOR ENGINEERING DESIGN

Month after month, more and more customers call on Rohr for engineering design in the development of Rohr-built aircraft parts. And for two important reasons. It gives our customer important technical and manpower assistance. It provides opportunity to coordinate design and Rohr production facilities from the start. Result? Savings in time, work and money for a fine finished product.

For the aircraft parts you need—remember the world of production skill that has made Rohr famous as the world's largest producer of ready-to-install Pow-R-Pax for airplanes. Remember that Rohr makes over 30,000 different parts for aircraft of all kinds. And remember to call on Rohr for skillful engineering design—good way to start the aircraft part you have in mind.

COMPLET

Applications of the City of Warsaw, 1833 and the Warsaw Chamber of Commerce, the City of Valerius, Neb., the City of Estherville, Iowa and the Etheridge Chamber of Commerce and the City of Imperial, Neb., consolidated in favor with the State of Iowa (See Introduction).

Investigation to determine whether forest service should continue its service in the following states: Alaska, N. D., Montana, S. D., Nebraska, N. D., and Washington, N. D., and provide service between these states: Idaho, N. D., in Washington and Montana, and all other states in the western United States.

President Milford Norrberg, seconded by chairman of the Charleston Columbia, a recent and Eastern Air Lines contract awarded on charter, the Chrysler Division signed. Both announcements complemented terms of a recent credit agreement, as the company had previously notified. It appears the matter will now be settled.

Walter F. Sears, Sec's authority to conduct military personnel services is confirmed by authority to Sign, 17, 1946

Investigation in defecation, whether Vol 178 for honey (possibly should be amended to suggest that Mrs. Rosenblatt and Dr. Yager be served with an affidavit against the Los Angeles investigation was conducted with Freedom Bureau of Co.

When Alaska Airlines' fuel and other costs increased to make its rates subject to the CAB investigation of airlines to which it applied pass on legislation rules.

DISCUSSION

Times World Airlines and United Airlines' complaints against American Airlines' proposal to operate a domestic competitive route into DC-7 represent demand for an expansion of the tariff provisions contained within the investigation is needed are defined.

Small Airways' application for a Hearing and San Francisco order.

INSTITUTE

United Airlines' permission to use Roberts Field through Mountain View Airport itself. United contends the Board, that is, the airport itself, not adversely affect the public interest.

COCKPIT VIEWPOINT

By Capt. R. C. Robson

Trapped in the Approach-Light Bog

(Part II)

—how does a DCU enter a black hole? This refers, of course, to the lack of event gradient reported from ordinary edge of runway lights and the resulting blackness of the runway. Even at Newark, where the instrument runway has twice as much light as any other in the U.S., the inadequacy

In understanding the reason for this inadequacy, some knowledge of the human eye is needed.

In the center of the retina, there is a small depression in which retinal blood vessels are non-vascularized and cones are exposed to light. This is the fovea. In the surrounding normal area, light must penetrate the 10 layers of tissue that make up the retina before it reaches the rods and cones.

Thus we see that the normal air has a central part of vases that is sharp and clear (clear vision which represents approximately 5% of the field of vision) and does most of the seeing.¹¹ Vision deteriorates rapidly as the narrowing goes to practically nothing at the extreme edge. In normal vision both eyes track simultaneously and both air focuses exactly on the same point.

What is the importance to a discussion of language?

consider it as a soft constraint, a point is forced to go into a location known to be the state passed. That is, the cut is based on *inference* and *field* motivation. The pointer (final) used attention, because of speed, must be short. Information received from the pointer of reason (which is outside the logic) (best) is strictly of minor importance. In short, the reason is the black link is first the leading cut, reason via the obj. of reason.

It will be found by plotting the forest area, that the cut can be made on an area more or as wide as the cut is high. Therefore, when crossing the running threshold at an altitude of 40 feet, anything more than 40 feet to either side of the line of forward vision (a total of 80 feet) is outside the limits of forest stand, crown and grade analysis for landing.

As the aircraft sinks to a landing height from the threshold, the runway edge as determined by the lights appears to move upward and outward. Side lighting now becomes more prominent, and so. Both eyes in fixed space rotate. With good RVR (excellent visual range), the lights further down the runway converge into the fuselage, fixed eye.

But visibility was still low enough to cut off this protest. On a 200-ft wide avenue, a RVB below 1,000 feet places the angular speed between edge lights at a little more than five degrees. Under the conditions, the car is steered into a road which furnishes no guidance whatsoever.

An indication of how valuable the random geometric pattern is to the pilot is given by the fact that 99% of the time, mostly an hour or so, a 45 feet to either side of the runway centerline. In bad visibility, there is no landing geometric pattern—only a black hole. How can we fill in the hole with surface plane definition?

Most likely by use of a double row of "arrow" type lights fixed mounted in the runway surface. These should be spaced 50 feet on either side of the centerline for a distance of 3,000 feet down the runway. Such lights are already in use at some airports in Europe and are available in the U.S.

As the centrifuge lights in the approach zone provide a positive indication of the flight path to runway lights provide adequate guidance along the runway. The lights are close enough together to be within the field of visual acuity set the break in centrifuge information from positive to negative leaves no doubt that this is the runway.

GENERAL ELECTRIC ANNOUNCES . . .

NEW J79 ENGINE FLIGHT-TESTED IN DOUGLAS XF4D

Designed for more thrust per pound of weight than any previous G-E engine, G.E.'s J79 has first flight in single-engine aircraft

79th FLIGHT ROLL-OUT Navy's Douglas XF4D was selected by the Air Force and General Electric as ideally suited for J79 tests—proof of the close co-operation between Armed Services and industry on this vital jet engine project.

G-E TEST PILOT Roy Pryor, checks XF4D engine instrumentation. During test flights at Edwards AFB, engine's stresses were measured by special telemetry equipment on the ground. Pryor was notified by radio of the test results.

Already the XF4D tests at Edwards AFB, California, have proved what many in the industry have known for months. The J79—General Electric's latest and finest jet engine—can develop more lbs. of thrust per lb. of engine weight than any previous turbojet developed by G.E.

"It was like having a tiger by the tail," said Roy Pryor, G-E test pilot, after he first flew the J79 in an XF4D last December. The J79's efficiency, light weight, and high thrust output made possible outstanding performance during military power checks, level flight runs—plus throttle burns during descent.

The joint Air Force-General Electric tests at Edwards are only a prelude to better J79 flights to

come. But they mark a significant "first" in the aircraft powerplant field.

Never before has a new American jet engine been flight-tested in a single-engine aircraft before initial delivery to military customers. The firm now building new planes which will use the J79, will get an engine with actual flight experience in a military aircraft—rather than an engine with only factory or flying test bed experience.

Today, over 35,000 G-E J47's power more Air Force planes than any other jet engine. The new J79 with its extremely advanced design and performance features, represents still another prime G-E addition to U.S. manpower. General Electric Company, Cincinnati 18, Ohio.

MARQUARDT RAMJET'S TAILPIPE glows white hot at peak of test run. Weighing 100 lb., engine produces high thrust.

Supersonic 28-In. Ramjet in Production

By Irving Stuenkel

VAN NARS, Calif.—A 28-in. diameter supersonic ramjet engine developed by Marquardt Aircraft Co. has become the Air Force's first such production component.

The engine weighs just under 200 lb. and produces thrust equivalent to 50,000 lb., under typical flight conditions, the company says. For speeds in the Mach 2.5 to Mach 3 range, this would be equivalent to an engine thrust rating approximating 10,000 lb.

The new ramjet is the first in a series of these supersonic engines which Marquardt has under development or in preliminary design stages.

Marquardt's experience with ramjet components is among the most extensive in the industry. Little ramjet engine developed by the company powered missiles, rockets and piloted aircraft in a variety of installations. One of these engines ran a 10-in. diameter test-bed burner under a Douglas B-76 used in a firing test-bed.

While the company will make no identification of specific ramjets for specific missiles it is known that these engines have powered the Boeing "Centaury" and Lockheed "N" supersonic test vehicles.

This is about one decade the ramjet has progressed from a scratch-built, preprototype to a refined flight proven supersonic engine. Today the

ramjet is demonstrating its operational reliability in missile flight at high Mach numbers.

Single-Spike Inlet

Marquardt's 28-in. ramjet has a 50 deg single-shock conical inlet spike and a deepened inlet cone. The relative position of the spike and the conical inlet lip is extremely critical to efficient engine operation. This requires precise manufacturing and assembly of the spike and the cone.

All of the inlet is the diffuser is ramble, where, simply has been kept to a minimum to limit the length of the engine and keep weight down. The diffuser consists of a double wall cone-

crete shell, which is the backbone of the engine. It is an efficient load-carrying structure on which other main engine components are hung.

Between inlet and inlet skins the diffuser shell incorporates glazing and electric wiring and also serves as a duct for the discharge air from a turbine-driven fuel pump.

Internal Systems

Mounted in the forward portion of the diffuser is a conical inner body supported by three struts which contain the fuel system and controls. The conical shape of the inner body serves as a controlling medium for the rate of diffusion of air passing into the combustion zone aft of the diffuser.

One of the diffuser support struts runs in, at its leading edge, runs as far forward as the before during the fuel pump. The aft portion of this strut then serves as a passageway to lead the turbine discharges air to the double wall of the diffuser where it is discharged outward.

The two supporting struts carry glazing and wiring from the diffuser shell to the fuel control system in the inner body.

The fuel control system provides in-

CONSTRUCTION DETAILS are shown in cutaway drawing of a typical 28-in. diameter supersonic ramjet.

FUEL AND CONTROL SYSTEM is housed in the forward section of the conical shaped diffuser.

SUPERSONIC RAMJET set up as a stand for test. Convergent-divergent nozzle is visible at right end of engine.

floated gyros bring 'em back alive

It's a tough deal to locate a pitching "flat top" in the middle of thousands of square miles of water - particularly on instruments. It takes rugged, clear-thinking pilots, and it takes rugged, accurate gyro instruments.

Floated construction of gyros built by Daystrom Pacific Corporation (American Gyro Division) assures you rugged integrity of gyro instruments that cannot be duplicated. This means your gyros will withstand extremes of shock and vibration without affecting accuracy or reliability.

Write today for complete details concerning installation and all available gyros now in production line at Daystrom Pacific Corporation (American Gyro Division).

permanently regulated. Sighting pickups are located in the wire and deliver to provide constant signals to the fuel flow regulator.

The regulator is adjustable to supply fuel to maintain a predetermined Mach number within limits, throughout the entire flight trajectory of the missile. The regulator can be adjusted for a prescribed flight trajectory to assure that the flow in the combustor does not exceed the fuel-air ratio limitations imposed by the combustor geometry.

The entire fuel control system is designed as a package unit to slide into the inner body on rails. Thus it can be withdrawn for any serviceability during ground checkout.

Fuel control package, with its, be-

lieve-hinged to best suit the launch requirements of the missile the magnet piston. One control package, can be for a short-duration boost application, as in the case of an air-to-air missile. Another control package can be designed for long-duration boost, or 45 sec., as in the case of a ground target missile.

Flow Control

Located at the aft end of the inner body is an aerodynamic flow control device designed to produce smooth and uniform airflow just the fuel injector and into the combustion chamber. Use of this device has led to substantial improvement in design.

Intermittent downstream of this flow control device, about midway in

A VETERAN SERVICE ORGANIZATION

World-Wide Service Facilities

SAFEGUARDS

Bendix JET IGNITION

A world-wide Bendix service organization of well trained personnel who have at their command the complete facilities of the service department of the Scintilla Division of Bendix, stands solidly back at the ignition equipment manufactured by this division.

This veteran service organization, with over thirty years of experience in resolving ignition service problems of all kinds, is equipped with the facilities, parts, and know-how to insure that every customer may continue

to receive the satisfactory performance built into Bendix Jet Ignition equipment.

It is important to remember that when you specify Bendix Jet Ignition you get not only the best in design and performance, but you are insured that wherever you fly, the finest service organization in the industry is readily available to maintain the quality that has made Bendix—The Most Trusted Name in Ignition.

noted in the stalling position with a G-seat of subjects exhibited 7G for 30 sec.

Loss of visual acuity under heavy G loads is not caused in the instant upon cessation alone, but also by the so-called effect of the apparent increase, in weight of the components of the eye, according to William J. Waite of the Army Medical Laboratory, White and that performance results indicate some loss of visual acuity is probably due to displacement of the crystalline lens of the eye under high G loads. Tests with the subject in the upright position and square positions indicate that the effect takes place regardless of the direction of the G load relative to the body.

The possibility of some other reason for the demand on acuity, such as distortion of the cornea by hydrostatic effects has not been discounted.

The dangerous effect of relatively low G loads over a long period of time may be receiving too little attention according to Lt. Cmdr. Frank B. Austin, USN (NRC). Austin pointed out that in a turning flight at high altitude relatively low G loads bring the airplane into contact with the buffet boundary at fairly high speeds. The fact that the danger was not from the direct effect of the G load in this condition, but from fatigue caused in prolonged firing and flight while avoiding the incipient high speed stall indicated he believed

Austin also presented a study carried

out on Navy aircraft showing the acceleration encountered in catapult launches, rags and arrested landings. The study was intended to provide a base line for most advanced studies.

Oxygen Systems

Present, breathing and delivery demand oxygen systems were criticized in Dr. John R. Pappas. He said that the advantages of the older demand systems have disappeared at the altitudes now being flown and that pilots are now the demand regulator set for 100% oxygen. The being the case, the complexity and unreliability of the older demand system cannot be ac-

cepted. Present breathing he called cumbersome and hindering. In the case of rapid decompression there was increased danger of injury, being required by the increased pressure. He said that these dangers are not justified by the additional 5,000 ft. of altitude made available by pressure breathing.

In a statistical consideration of the relation of age and experience to aircraft accident frequency, Col. H. G. Mosch, USAF, pointed out that a disproportionately large percentage of accidents involve young pilots. However, he noted an upward curve in the proportional accident frequency figures for older pilots to get aircraft.

Stable Platform Gyro

This gyro used in a moving chassis for stable platforms used in aerial photo reconnaissance aircraft. Features include easy, high sensitivity and very low drift. Labeled Bendix Type AGN-3 normal gain, the instruments are manufactured by Avco Laboratories, Inc. 1406 Millbrae Avenue, Long Island City 1, N.Y.

at **CPT**...A New Kellering

From the picture at top, these aircraft landing gear rails are Kellered at one time. After being machined are adjusted by rollers.

At CPT, we've installed eight BG-22, 3-spindle Pratt & Whitney Kellering machines. These 8 Kellers added to our single-spindle and two-spindle Kellers give us a total of 10 machines.

Each of the 3-spindle Kellers can produce three identical complex parts from a center...at the same time. Per-piece cost is reduced, delivery is speeded, uniformity of contour and surface is insured. Even the most intricate and convoluted surfaces are accurately machined by tools that duplicate the contours of the master pattern.

In addition to the services of our battery of Kellers, CPT offers you the services of a complete collection of modern machine tools of all types; lathes, gap lathes, turret lathes, and mills, rolling machines, grinders, hobbing machines, and chord grinders.

Military, Airlines Push Single Sideband

By Philip J. Klaus

An old idea made practicable by new techniques, will double the number of simultaneous communications channels available in the congested high-frequency (2 to 30 mc) band. Called "Single Sideband" or SSB for short, it also will improve intelligibility under adverse conditions and provide a sizeable increase in efficiency, power and range.

Inquiries for the switch from present "double sideband" or AM transmission to the new SSB mostly come from the cockpit in the HF band. Both the military and the airlines prefer what the services cannot find provided by HF channels.

Single sideband general equipment suitable for a general communications channel is available in mid-1977 for line equipment with internal package voice line.

Within five years, partial use of SSB in the Air Force, Navy and with some offshore airports exists.

Codman Radio Co. is developing both ground and offshore SSB equipment which is slated for USAF operational evaluation late this year at the Rome Air Development Center. Radio Corporation of America is marketing test techniques which will make it possible for the USAF to convert its present ARC 21 transmitters for single sideband operation. The reform will dual bandwidth in addition to SSB developments. But these need to be proven and SSB is so promising that they are not waiting for completion of the military program.

Airline Electronic Engineering Center (AEEC) of Aeronautical Radio, Inc. is last practicing a dual-channel (specification for air traffic SSB systems, receiver-transmitter).

International Air Transport Association is Montreal to draw up standards, operational requirements for SSB and to consider the problem of compatibility.

Compatibility

The IATA meeting discussed compatibility of the major path of compatibility. This problem arises because a "pure" single sideband (SSB) system and the double sideband (DSB) equipment are in use.

A long transition period results in required to share power in the same band and the switch from DSB to SSB will use no energies. It is also obvious

- | | |
|------------------------|-----------------------------|
| SSB
Single Sideband | 1 Doubles No. of Channels |
| | 2 Increases Effective Power |
| | 3 Improves Intelligibility |

that aircraft cannot afford to carry both DSB and SSB equipment.

For this reason, new SSB equipment must be designed for "half-sideband" operation. That is, it must be able to communicate with aircraft in ground stations equipped either with the present DSB or the new SSB. It is a combination of frequency, not less, p. 61. Fortunately, this is not an insurmountable problem, although it does create a problem for the SSB equipment designer's tool.

SSB Advantages

Single sideband offers several advantages over the present DSB.

Twice as many channels available. Because voice intelligence is transmitted on only a single sideband and because of the improved frequency stability, channels required of an SSB system at least twice as many channels can be obtained from the same radio spectrum as with DSB.

Increased power in selected power. In a conventional DSB system, approximately two-thirds of a transmitter's power goes into the carrier, the remaining one-third is divided equally between the two sidebands. With a suppressed carrier type SSB system, nearly all of this power goes into the single sideband which carries the useful voice intelligence. Although the theoretical doubled efficiency of sideband power is not fully realized, it has been demonstrated that a SSB transmitter rated at 100 watts peak power can match the performance of a conventional 400-watt AM transmitter.

It is these SSB advantages that motivate both IATA and NATO meeting. This means, in effect, reduced power without reduced power output in particularly adverse conditions of the somewhat reduced efficiency of half-type HF transmission. The relative advantage of SSB

over DSB depends upon the propagation conditions. As conditions deteriorate, SSB's advantage grows, as shown in the tables, p. 64.

Improved intelligibility. In long-distance HF DSB propagation, sea return noise, especially a slight phase shift due to multipath transmission, can cause the desired signal to partially cancel the effect, producing distortion and loss of intelligibility. Fading in single phase shift of the carrier can produce similar results. However, with a suppressed carrier type of SSB, these problems practically do not occur. Although there are other problems peculiar to single sideband

Several Types

There are several different types of single sideband systems, but the two which are most likely to see use in military and civil aviation are:

Suppressed carrier. Here the carrier wave of the transmitted signal is suppressed (usually to 20% of the transmitter output) to perhaps 50 dB. Without a carrier which can be used by the receiver for demodulation, the SSB receiver must contain an extremely accurate and stable reference to generate its own carrier frequency. Similar stability and accuracy requirements are imposed on the transmitter. With such an accurate frequency reference, an automatic frequency control (AFC) circuit is required in the receiver.

Controlled carrier. In this type, of SSB the carrier is suppressed during transmission of voice intelligence, but is transmitted during brief intervals when there is a pause in the voice modulation. It is usually recovered in a carrier power level to maintain constant average power output from the transmitter, both during modulation and carrier transmission. The receiver employs AFC circuits which have been activated by bursts of carrier power and which function to maintain receiver

Introduction to Single Sideband

During the coming months, civilian and military aviation people will encounter the new term "single sideband." To provide a background for understanding the new technique, let us first review the present standard transmission.

CARRIER. In conventional radio transmission, the "carrier" provides a "highway" for transporting the desired voice intelligence from the transmitter to the receiver and for converting it into audible intelligence. The carrier is an oscillating wave of radio energy whose frequency corresponds to what is normally called the station's broadcast frequency. (See Fig. A.)

MODULATION. The technique by which voice intelligence is superimposed on the carrier is called "modulation." The most common type of modulation employed in present communications is called "amplitude modulation," or AM. With AM, the carrier wave's amplitude is varied in accordance with variations in the amplitude of the modulating voice or tone. (See Fig. B.) The frequency of which the carrier wave amplitude changes varies in accordance with the frequency of the modulating signal. For example, a 1,000 cycles/sec. modulating tone will cause the carrier wave amplitude to oscillate at a frequency of 1,000 cps (Fig. E) just half that of 2,000 cps modulation. (Fig. C.)

MODULATION. Modulation of a carrier produces a complex wave consisting of three individual waves: the original carrier, plus two sideband "sidebands," which carry the modulation or voice intelligence. Because AM produces two sidebands, it is sometimes called "double sideband," or DSB. For example, a 2 mc. carrier (2,000,000 cycles/sec.) modulated by a 2,000 cycles/sec. tone will produce one sideband whose frequency is equal to the carrier frequency minus modulating frequency, or 1,998,000 cycles, and another equal to the carrier plus modulation frequency, or 2,002,000 cycles.

BANDWIDTH. The amount of radio spectrum required to

transmit the desired intelligence is called "bandwidth." For the previously cited example of a 2,000 cycle tone modulated, a bandwidth of approximately 4,000 cycles would be required to accommodate DSB to accommodate the two sidebands. For AM voice transmission a bandwidth of 3,000 cycles, plus an adjoining band on either side to prevent interference from adjacent channels, actually is required.

DETECTION. When a voice modulated carrier arrives at a radio receiver, it is amplified and converted to a form, usually weak with frequency, and then goes through a process known as "detection" or "demodulation." In this process, the two sidebands are stripped of the carrier, then recombined. During recombination, one sideband is discarded without detection effect, since the voice information is contained in the remaining sideband. The resulting audio frequency signal, performed after the original voice modulation is then fed to the loudspeaker. Although the carrier performs a useful function in the demodulation process, and may also be used for "automatic frequency control" (AFC) to keep the receiver continuously tuned to the transmitter, it does not add much content any of the desired voice intelligence.

SINGLE-SIDE-BAND. If one of the two sidebands is filtered out before it reaches the transmitter's power amplifier, the same voice intelligence can be transmitted on the remaining single sideband. Instead of approximately one-third of the transmitter power going into each sideband, as with carrier-based AM, the modulated power (one-half) can be concentrated in the single sideband, the side increasing effective range. Equally important, the bandwidth required for SSB is approximately one-half that needed for DSB. (See Fig. D and E.)

SUPPRESSED CARRIER. If the percentage of power which goes into the carrier is reduced further, none of the transmitter power can go into the single sideband. Given to the extreme, this results in "suppressed carrier" SSB.

Designed for Data Recording

Designed from the start for data recording, Flight Research Items and Data Systems include all of the features required for accurate data recording and rapid data reduction.

Featuring the patented synchronizing clutch and circuit which permits the operator of any number of channels synchronized to a better than 1.5 milli-seconds, these channels also include an standard equipment.

- Pulse operation to 10 cps
- Civil speeds to 40 cps
- Accurate channel markers
- Amplifying
- Coding filter
- Shutter output pulse
- Integral power
- Dual precision mounts
- Compact, rugged design

Let photographic data recording solve your problems. Our engineering staff is available to assist you.

RELATIVE ADVANTAGES OF SSB

SINGLE SIDEBAND advantage over AM in propagation conditions

frequencies during transmission of voice modulation. This gives users the requirements for frequency reference accuracy.

Even the development of recent single- and power channels, the superposition of SSB is generally ignored. The USAF sponsored Collins equipment is one of the approved carrier types. It is a strong performer for the supported carrier. However, with portable carrier, conventional SSB called for a system which could be repeated either as approved or controlled carrier, until such time as the reliability of the carrier frequency reference is proven.

The Problems

Work SSB's more advantages. It is believed to exist in the military and airlines have apparently been so slow to adopt it for ground-to-air communication. Single sideband has been "hiding" on the horizon ever since 1917, when it was first conceived by a youthful marine named Carson. mid-sideband (SSB) is an acronym named "Amplitude" (from the Latin, adding "Amplitude" once remarked that single sideband has been around "longer" even for those who think that "it" is.

Although SSB has been used in commercial and military ground-to-ground communications for some years, and lately has become quite popular with radio "hams", several inherent problems have discouraged its use for ground-to-air communications.

• Excessive accurate frequency reference needed. Suppressed carrier SSB demands a stable frequency reference accurate to within one part in a million or better. This is roughly 100 times the accuracy required for conventional DSB equipment. If the reference frequency is the natural daily cycle (10 cycles in two parts in one million at 25

sec), it will cause a loss of voice intelligibility, and a slight reduction in intelligibility. If the shift is more than 700 cycles, serious loss of intelligibility occurs. To have the required frequency accuracy, the pitch drops (and rises) to the sound of a phonograph record when turntable speed is below normal) this accurate use, the frequency reference must also be used as a guide.

• Doppler shift effect. A radio signal transmitted from a moving aircraft (or a moving ship) undergoes a shift of frequency due to what is called the Doppler Effect. For example, at 30 sec, a signal transmitted from a fixed ground station and received by a plane traveling at 672 mph undergoes a 10 cycle shift. This Doppler frequency shift goes up directly with speed and frequency. It affects with the highest of suppressed carrier SSB in the same way as a shift in the base frequency reference. (The speed of modern aircraft would produce excessive Doppler frequency shift in the VHF band which explains why the SSB technique is limited to use at lower frequencies.)

With a pure suppressed carrier system, there is no way to lock the Doppler shift problem without increasing system complexity. However, if certain aircraft speeds combine to increase the present suppression range, it can be necessary to transmit a pilot tone for reference and use automatic frequency control to prevent audio Doppler shift according to E. W. Pappert of Collins Radio. However, Pappert hopes that this can be avoided because of increased system complexity.

Feasible Techniques

Recently developed techniques to increase accurate reference and control (frequency reference, frequency reference, etc.), eliminate system complexity, and

specifically are matched with operating the door to practical two-way single sideband. The frequency reference is probably the most satisfactory.

Collins, for instance, has developed a relatively small sideband crystal oscillator which makes it possible to secure a frequency accuracy of one part in 100 million for each of the selected crystals," according to Pappert. The advantage holds the frequency to within one part in 10 million to 100 million over a 24-hour period.

The development of power circuits for transmitters that amplifiers has resulted in a great simplification of transmitter design for single sideband applications. The reason is that the power circuit, with its simple control system and accurate power gain, greatly reduces the number of stages of amplification required and minimizes circuit complexity.

The use of RF feedback improves the amplifier linearity and reduces the distortion which are very important when multi-channel transmitters are applied to an SSB system. Pappert points out: Distortion in SSB, like amplitude distortion in conventional AM, partly destroys single sideband's advantage of requiring less bandwidth.

Two techniques generally used to get rid of the one initial sideband in SSB, are the filter method requiring a

highly selective filter with sharp cut-off characteristics, and the phasing method, which uses carefully matched phase shifting networks. In both cases, there have been significant technological studies during the past several years.

Bi-Mode Operation

To prevent compatibility problems during the period of transition from the present DSB to the new SSB, both the military and the airlines are installing upon equipment designed for bi-mode operation. Initially, single sideband transmitters are installed in conventional DSB/AM receivers without modification, if the SSB trans-

mitter includes sufficient carrier power to permit the AM receiver to discriminate the incoming signal.

To permit bi-mode operation between an SSB transmitter and present DSB receivers, the transmitter will be designed to radiate a carrier plus single sideband. The receiver needs no mode selection.

In present an SSB receiver, to handle a signal from a DSB transmitter, it will be designed to include both a SSB detector and an AM detector, with the latter operating during communications with a DSB transmitter. No modification will be required in existing DSB transmitters, providing they have suf-

Systems Engineers!

Hitch your career to rocket power!

Take a good look at your future. Why not see what Rocketdyne has to offer the Systems Engineer of your caliber? Rocketdyne, the largest producer of liquid propelled rocket engines in the field of rocket propulsion, is a division of North American Aviation, Inc. As a Systems Engineer with this industry leader, you will earn handsome rewards with your ability. You will acquire personal and professional satisfaction by working with the most advanced state of your profession. At Rocketdyne, your future depends on you.

Rocketdyne now needs Systems Engineers with training and experience in:
 THERMODYNAMICS FLUID FLOW
 GAS DYNAMICS SYSTEMS ANALYSIS
 HEAT TRANSFER RELIABILITY
 ENGINE PERFORMANCE ANALYSIS

To qualify the Systems engineering candidate in the Analysis of Liquid Rocket Engines and Propulsion Systems.

If you are a graduate with a B. S. or advanced degree in M. E., A. E., or Ch. E. or an experienced engineer with a background in Heat Transfer... But even in your career—your future—your future today too.

You reduce manufacturing costs the moment this ingenious new "grey box" enters your plant

The new electronic measuring instrument pictured here is a Hewlett-Packard Model 521A Industrial Counter. It can reduce your manufacturing costs materially by measuring machinery speed, RPM and RPS, frequency, pressure, weight, and temperature faster, more accurately and without elaborate setups. Results appear in direct number form. Operation is simple and does not require technical personnel. The price—\$435—4.40 for a high quality electronic measuring instrument.

Model 521A Industrial Counter is one of over 250 basic electronic instruments Hewlett-Packard has developed for science, the military and industry.

INVESTIGATE! It's a simple matter for the Hewlett-Packard engineer in your city to evaluate usefulness of this instrument to you. Write today, telling where the "grey box" should see.

World leader in electronic measuring equipment

588 ground equipment probably will become available and go into service before its airborne counterpart becomes available. During unforeseen difficulties, aircraft equipped with D80 receivers and transmitters will be able to communicate with 588 ground stations without modification of the airborne equipment. However, this is one of the things which the USAF expects to check during its evaluation tests of the Collins 588 system next year.

Despite the basic differences between D80 and 588, there is good reason to believe that the transition to this improved type of air-ground communication can be made without undue stress, thanks to military, airline and aerospace manufacturers' wide recognition of the problem.

In the second and concluding article of this series, Aviation Week will describe some of the design details of single selected equipment now under development in Collins Radio Co.]

1967 FILTER CENTER

► **Completed To End All Complaints**—Philo is developing a two airborne transceiver digital computer designed to perform all computational tasks about an airplane, including such things as fire control, navigation and communications. (Similar "central station" computers are under development by Litton Industries and possibly other firms.) In addition to this airborne computer, Philo is developing general purpose industrial and special purpose military digital computers, all employing transistors. Philo calls its family of computers Transac L, H, M, etc., which its computer language stands for "TRANsactional Automatic Computer."

► **Electronic Patent Issues**—A comparison of U.S. electronic patents filed will soon be available to firms who subscribe to a service provided by Information for Industry, Inc. Company's address: 1108 16th St. N.W., Washington, D.C.

► **Transistor Pikes Slashed**—General Electric has made its third price reduction on transistors within the last 14 months. Latest cuts, ranging from 22 to 57%, apply to two alloy junction PNP types (2N117, 2N114) and three alloy-junction NPN transistors (2N163, 2N160A and 2N161). New prices range from \$1.50 to \$1.80 each, to equipment manufacturers.

► **MAC Triplex "Bulldozer"**—McDon-

How to Blind a Radar "Eye"... and Why

The "why" is easy

— so our aircraft can elude the piercing eye of enemy radar.

The "how" is not easy — nor can it be revealed.

But Maxson-developed, Maxson-built electronic countermeasures are today effectively blinding the eyes of search and fire-control radars.

Visit our booth at the National Conference on
Aeronautical Electronics Systems 8-10 May 1970.

MAXSON develops and manufactures systems, subsystems, and components in navigation, navigation, electronics, and special devices.

THE W. E. MAXSON CORP.

4801 HARRY STREET, NEW YORK, N.Y.

Plant in Old Forge, Penn. and Long Beach City and New Orleans, La.

will Aircraft Corp. has begun delivery in 1969,000 worth of analog computer equipment which will triple its previous computing capacity.

► **Java Section**—An electronic countermeasures (ECM) business intended to protect the USM, to train ECM operators under simulated tactical conditions, is being developed by Victor Lee, under Wright Air Development Center sponsorship. Plans, dated for delivery this month, list a rack up of ECM positions located on typical aircraft, with an instructor's console to permit monitoring of student performance.

► **Ceramic Tubes Now Available**—Eich-McCullough, San Bruno, Calif., is now able to supply prototype quantities of its radically different high-temperature vitreous ceramic vacuum tubes in two types: CDB-18, a diode triode equivalent of the 6BN7, and the CDB-15, a ceramic equivalent of the 6AR5W pentode. The Emac stacked tube (AW Aug. 22, 1969, p. 61) developed under USAF sponsorship, is being tested by a number of aircraft groups, including Boeing, Convair, and Hughes Aircraft Co.

► **Attention, Exhibition—Avionics firms** which like to exhibit their products at major conventions should take note of the following:

- Aug. 21-24 Western Electronic Convention, Los Angeles
- Oct. 8-9 Symposium on Aeronautical Communications, UFAO, N.Y.
- Oct. 29-30, East Coast Conference on Aeronautical and Navigational Electronics, Baltimore

► **Arthurs Wanted**—The Technical Paper Committee for the second annual Symposium on Aeronautical Communications (Oct. 8-9, UFAO, N.Y.) is seeking prospective authors. If interested, submit a 200 word abstract to Mr. Fred Moskowitz, 1014 No. Madison St., River, N.Y. before July 1.

► **Insulated Plastics**—A new technique for improving the heat resistance of polyethylene plastics by irradiating them with gamma rays from Cobalt-60, has been developed by Strahlen Research Institute and the Sylvania Plastics Corp. Segment, located in Redwood City, Calif., now is in mass production on the improved plastic.

► **Low Efficiency**—Power supplies in avionics equipment frequently have less than 50% efficiency, a Rome Air Development Center study shows. Use of new silicon rectifiers and magnetic amplifiers in regulated power supplies can boost efficiency, the study indicates.

NEW AVIONIC PRODUCTS

Computers & Accessories

► **Digital computer and differential analyzer** can be provided as a general purpose computer unit or with a digital differential analyzer accessory unit. Flexible programming permits execution of simplified recursive sub-routines for present with limited computer experience. Electric typewriter input/output and a high-speed photoelectric paper tape reader and paper tape punch.

an standard equipment. Up to four magnetic tape storage units, each with 100,000 "word" capacity, can be provided. Computer price is far below that of existing equipment of comparable capacity, according to consultant Roderic Computer Division, 5610 Arden Vista St., Los Angeles 45, Calif.

► **Assessing aircraft performance computer**, a special analog computer for use by non-aviation engineers, is now available in a new Model 211. New version incorporates a "three-regional" readout which simplifies calculation of aircraft range and endurance. Redesign and selection of chassis components.

RELIABILITY

From design to production, Whittaker gyros are built with maximum care. This includes continuous testing of components and assemblies and 100% inspection tests at all production stages. While hundreds of gyros shipped each month, Whittaker has an overall customer reputation of less than 1%.

NIKE MISSILE part produced at Rheem's Denney Aviation plant.

MISSILE WARHEAD developed for Hines John and Cooper is in test.

POSITION is tested at night. Warhead was developed by Rheem's Laboratory.

ANTI-AIRCRAFT missile tested against B-25 wing in ground.

Rheem's

Denney, Calif.—Vacuum development is the primary function of Rheem's Research and Development Laboratory.

Among the laboratory's 22 current prime contracts are three major programs:

- The missile development projects are underway for the Air Force. One of these projects is approaching the development stage while the second is still in its initial phases.

- Specialized vacuum warfare development work is being conducted for application to Hines John, Cooper, and Nike B missiles for Army Ordnance, and to the Bomarc for the Air Force.

- Development and installation of range instrumentation equipment is projected for the Air Force Flight Test Center, Edwards AFB, Calif. One of the programs is to provide the capability of monitoring test aircraft at greater speeds, altitudes and ranges than is possible with present systems.

- Practice range development is being carried out for the Air Force, Special Weapons Center, Kirtland AFB.

In addition to these projects, the Research and Development Laboratory has submitted a design proposal to the Navy Bureau of Aeronautics for a jet-powered high subsonic target drone. This is now being evaluated in a BuAer competition.

Laboratory Growth

Rheem's Research and Development Laboratory has been in existence only about three years, starting with a nucleus of about 18 people. Today it employs about 500 engineers, technicians, model shop specialists and supporting personnel.

It already has done about \$7 million worth of work, has a backlog of about \$4 million.

The laboratory is still expanding. At the present rate, of growth, it is anticipated that it will have 2,000 people engaged in principal programs which will occupy plant facilities in excess of 700,000 sq. ft. within the next five years. Present facilities occupy 72,000 sq. ft.

The Research and Development Laboratory was established to provide new solutions for production for Rheem Mfg. Corp., the parent organization. To broaden these fields of production, the laboratory has been organized for three principal activities—missiles, aviation electronics and electronics.

Each of these activities is set up as

PRODUCTION

Laboratory Develops Missiles, Electronics

an independent action within the laboratory to better meet the specialized requirements of government agencies.

The basic philosophy underlying the operation of each section is that it must be self-supporting financially. This means that each section is responsible for the creation of new ideas, methods of development and the promotion of these ideas into contracts. These contracts must be taken through the research, development and prototype manufacturing stages, showing a profit.

Profits Invested

This has been accomplished thus far through the acquisition of the Research and Development Laboratory, and the profits earned have been reinvested for additional expansion in the form of new equipment and floor space.

From the time of its organization, the Research and Development Laboratory has recognized the importance of location in certain technical fields.

For example, in guidance and control, the laboratory is skilled in managing the aspect of work, but it is not skilled to develop these areas. Actual development of guidance and control

equipment accordingly, has been subcontracted to specialists in the field.

Rheem itself is an important subcontractor. The company's Denney Aviation Plant is expanding its production facilities to take care of subcontracts in both the aviation and jet engine fields.

The aviation subcontracting agencies a good cross-section of aircraft and missiles, the F-104, F-102, F-100, F-7V, F-7, F-39 and B-52 parts. Also included in Rheem's subcontract work is Nike guided missile parts.

Rheem is now working up to produce the complete equipment for the Lockheed F-104. This includes the movable horizontal stabilizer, rudder, tail decelerator and fin.

Tooling will be completed this summer and parts for the F-104 will come off the line this fall.

Currently, Rheem is doing structural redesigns of the fin for the Convair F-102 and is tooling up for its production. Tooling for production of the F-102 windshield framing and canopy is in progress. Parts will be delivered this summer while windshields and canopies will follow shortly thereafter.

For the North American Aviation 1-1000, Rheem is in production on the aft fuselage, flap, wing tips, fin, saddle, wing leading edge ribs and movable horizontal stabilizers.

B-52 engine seats for the bombardier and navigator are being fabricated for Boeing.

For Douglas, Rheem is producing Nike five, center and aft body sections, fuel tanks and propellant pressure vessels.

Rocket Tabs

The company is producing the nose section for the Lockheed F-7V, for the F-104. Rheem is in production on the nose, inlet ducts, air scoops, and seats.

For the Northrop F-500 and H, Rheem is fabricating the rocket tabs and the nose section.

In the jet engine field, Rheem is tooling up to produce the afterburner and the intermediate case assembly for the Pratt & Whitney J57 being built for Ford. On the Ford built J57, Rheem is now producing the inlet guide vanes, diffuser case and bearing housing.

For the Allison J71, the company is producing turbine nozzles.

HIGH-VELOCITY IMPACT machine roll apparatus, the general arrangement in prototype being built by Convair.

Convair Forms Metals by Impact

San Diego—A new high velocity impact process for forming metals has been devised at Convair Division of General Dynamics Corp.

The forming principle is now being embodied in a double impact machine, which offers absolute definition of parts, eliminating subsequent hand forming.

According to T. E. Pips, Convair's director of wireforming research and development, the high velocity impact forming scheme is expected to eliminate the need for hot-forming of titanium alloy parts.

It is believed that this rapid forming method may be a satisfactory one

for forming stainless steel without the need for working the material at sub-zero temperatures.

Convair's mechanism of what the high velocity impact process will achieve is based upon various experiments with a special punch utilizing an explosive-type charge in a series of increasing loads.

Because of the inherent involved in handling and controlling explosives,

Check and double check your level WITH

P-8483 weighs only 1.72 lbs. . . operates 1,000" to 4' 10" range. . . from -45 to 160 deg. F. Includes two hermetically sealed reeds. SPST, 5 amp motor load or 20 volt DC, 150,000 cycles maximum. Conforms to MIL Specification. Ready and tested for airborne long-term hostile conditions.

P-79140 weighs 1.20 lbs. . . for -50 to 160 deg. F. use. Conforms to DAFI Specification sealed reed. Rating-20 amp at 20 volt DC, 150,000 cycles maximum. Pro-duct with patent pending of switch when used in dry. Conforms to MIL Specification.

REVERE DUAL FLOAT SWITCHES

Revere dual float switches have multiple applications. Used for automatic cut-off control in refueling operations, remote indication of fuel or fluid level in tanks, automatic C.G. control to actuate pumps or valves.

Revere Dual Float Switches allow use of two separate systems either as emergency or two-level control. Floats are only moving parts . . . non-absorbent for long-life accuracy. Permanent magnets in float actuate hermetically sealed Glaswitch® at precise levels. Vibration-proof, shock-proof. Many types available.

Bulletin T250 and
T251 describing
Revere Float Switches.

Corbin sought a safer, simpler design source. It was discovered that high velocity, high force impacts could be obtained with a pneumatically-actuated actuator which had been developed at Corbin for shock-testing of structural components.

The actuator operates on a thrust amplifying principle. Basically, it contains two pressure chambers in line and separated by a plug.

One of the chambers is fitted with a piston fitted with a seal which closes off an orifice in the separating plate when the force behind the piston is such that it opens the face of the piston through the orifice.

When the force acting on the piston through the orifice overbalances its counter force, the actuator is pneumatically triggered. This releases the inflow and allows the pressure to rise on the entire face of the piston, producing a large, unbalanced thrust which imparts high acceleration to the desired object (load and seal) of the actuator.

Close to constructing a prototype high-velocity impact firing machine, in using two actuator opposed pistons, a force, in lbs., forming length of approximately 12 inches for. Closing speed of the two pistons will be 200 feet-per-second.

The machine will serve as a laboratory device, to evaluate the advantages of extremely high, fast-acting forces in impact testing and to compare the speed accuracy of the process with the slow accuracy of the hydro-pneumatic.

Results obtained with the prototype machine will be used as a basis for design of final production machines.

The prototype is scheduled for completion this summer.

American Contracts For Idlewild Terminal

American Airlines has signed a 15-year lease with the Port of New York Authority for construction of an extended passenger terminal building at New York Idlewild Airport.

American is the first carrier to contract with the Port Authority for passenger facilities in Idlewild's "terminal city" development. Eastern Air Lines and United Air Lines signed last Sep. tenders.

According to a joint American Airlines-Port Authority announcement, American will pay an annual rental of \$75,000 for the facility. The terminal will be located on an 18-acre site, will be able to handle 12 aircraft simultaneously and contain ticketing, restaurant and similar passenger accommodations.

First KC-135 Jet Nears Completion

First U. S. jet transport production line has become an reality at Boeing Airplane Co.'s Renton, Wash., plant where the second KC-135 jet transport is nearing completion. It makes a sharp contrast with planes produced KC-97. Most of the production lines (background, bottom photo). Boeing's assembly line attached to a KC-135 center section (photo, right), plane depicted at top and bottom left, wing sections attached to fuselage. Note the legs for which main landing gear assembly was the first jet transport in top photo (above ground). Newcomb already has been started.

Boeing KC-135 Superfortresses will be powered by four Pratt & Whitney JT3D turbo-propellers.

NEW AVIATION PRODUCTS

Peckett Flight Computer

E-I peckett-flight computer enables available a long scale of wind speeds, airspeeds and ground speeds. It is equipped with a scale with to solve wind vector and other problems with a minimum of steps. For example, on a high-altitude wind vector problem, the E-I will provide the answer with one setting, three readings and two scales.

Unit can also be used as a protractor.

Meter for Coolant Pumps

New line of engine-mounted explosion-proof Type AK aircraft meters for coolant pumps are available in ratings from 1/1000 to 1/7th hp within a speed range of 2,500-14,000 rpm. Speed breakers are available that provide a maximum break life of 500 hr at an altitude to 60,000 ft.

Westinghouse Aircraft Equipment Dept., Wapakoneta 3, Ohio.

Remco Moist Package

A self-contained, independently operated personnel remote heat solution for helicopter refueling is also applicable to all tankers, boost converters and vapors only use, heat to melt.

Unit is basically a 600-lb capacity heat exchanger to include all necessary controls and protective devices. Permeant materials required in the circuit are two stainless steel, plastic, stainless steel, and their wiring. Installation is made by bolting the heat exchanger in support to the existing heat exchanger and connecting the hydraulic and electrical fittings. A pump is included in the circuit's engine and connected to the heat exchanger.

Features include: level-mounted mechanism, anti-siphon device, electrically actuated, self-contained, cable control, cable gas-out and recirculation controls, automatic, automatic-on control and automatic shutdown brake.

Vickers, Inc., 1402 Oakman Blvd., Detroit 32, Mich.

and to compute pressure, altitude, weight, temperature, and airspeed. 4754 N. Kedzie Ave., Chicago 18.

Frequency Change Generator

A line of synchronous motor-driven frequency changing generators to convert 60-cycle current to 400-cycle power source, accurate enough for aircraft and missile testing are available in portable or stationary mountings.

Sales listed in 5, 10, 15, 30, 45, 60

THE MEN IN THE SHOPS INFLUENCED US

"Your inquisitive customer list—and the many good reports from pilots using your engines—were two reasons we picked Airwork as our overhaul agency. But the most important reason was the confident, capable look of the men we saw working in your shops; the same men that would work on our engines, too."

E. Reed Zimmerman
Chief Pilot
New Holland Machine Co.

8 out of 15 "Million Miles" Safety Awards went to pilots flying Airwork Overhaul engines.

"4 years and 2100 flying hours with your engines confirmed our choice," says Co-pilot Robert Chase.

and 754-4; capacities, output voltage and frequency, is not affected by voltage fluctuations of the incoming power supply. Regulation of output voltage is $\pm 1\%$, controlled by a slide-type (capacitive amplifier) voltage regulator. Motor Generator Corp., Hobart Brothers Alliance, Troy, Ohio.

ALSO ON THE MARKET

Snap-back recessed handles for use on instruments, space parts boxes, etc., meet clearance, environmental and physical test requirements of MIL-T-945A and MIL-1-4734. Available in three models: SK-M126A, and SK-M126A of steel construction for load capacities from 750 to 500 lb., and aluminum SK-M1-100 for 75 lb. capacity—Klosterline Inc., Fort Jervis, N. Y.

Lookalikes for aircraft nose in complete range of diameters, gap lengths and head styles, available in alloy steel and

dimension alloy. Tension and shear values are in accordance with ANS-Bolt-to-Cherry Bolt. Division of Townsend Co., Santa Ana, Calif.

MH9900 engine mount is used to be lightest and strongest solution mount designed specifically for R2500 C engine. Mount includes an aluminum housing and separate steel stud stud in cast, mounted and replaced if damaged. Due to interchangeability of the two mount parts, a new steel is not necessary if bearing is damaged. See mounts per engine weight 217 lb.—MB Manufacturing Co., New Haven, Conn.

Permeated 196 Plastic Pika-Solvent Activated is suitable for die casting and conforms to military specifications for

design predictability

Trying to firm up new fuel pump specs? Well, stop staring at your slide-rule...call Hydro-Aire right now. The performance of our HY-V/L* Fuel Booster Pump is as predictable as units at a picnic. We'll show you a simple chart method that'll pull the clouds out of that crystal ball. Yes, the HY-V/L* can be tailored to your specific needs. And that has already been done by such customers as Chance Vought, McDonnell, North American and Douglas.

CONVENTIONAL 60 KVA GENERATOR

NEW STATICALLY EXCITED 60 KVA GENERATOR

Static exciter components mounted within the stator of the Lockheed Electra replace the rotating exciter of conventional generators. This design simplification reduces generator overhang, increases by approximately 180 pounds, overhauls, and improves generator cooling and ability to withstand vibration.

Why Lockheed Electra Will Use New General

DESIGN SIMPLIFICATION GIVES RELIABILITY DEMANDED BY TURBINE-POWERED AIRCRAFT

The new Statically Excited Generator combines the proven design principles of the conventional General Electric generator with the increased performance potential of static excitation.

Unscheduled delays due to rotating exciter failure or lack of residual magnetism are eliminated. Mounting stress is reduced because static exciter parts do not need attraction between major aircraft overhauls and commutator underscoring and control brush setting at time of overhaul are eliminated. Reduced size of the new generator simplifies removal and installation. Also radio interference problems are greatly reduced by elimination of the commutator.

Free board due to energy available for feeder fault after trip is maintained because the static excitation system retains less than one volt a-c while rotating exciter systems have residual of from 80 to 180 volts. Design improvements in the new generator allow higher operating temperatures, permitting one generator to carry the load of two under emergency conditions.

For further information on the new Statically Excited Generator contact your nearest G.E. Apparatus Sales representative or write for bulletin GEA-5015, Section 310-100, General Electric Co., Schenectady 5, N. Y.

Electric Statically Excited A-C Generators

Fast Response Improves Performance of Electronic Equipment

APPLICATION OF FULL LOAD—Normal voltage is reached in .050 second after application of full load. Voltage dip reaches 90 volts—90% of normal voltage*

REMOVAL OF FULL LOAD—Normal voltage is reached in .050 second after removal of full load. Maximum overshoot is 130 volts—131% of normal voltage*

SHORT CIRCUIT SURGE-UP—Advances full short circuit output to 437 second after three phase fault. Steady state current is 380 amperes—347% of rated current*

*Performance obtained with a typical 60 KVA model.

Progress Is Our Most Important Product

GENERAL  ELECTRIC

TITANIUM

North American Aviation's F100 uses large quantities of Mallory-Sharon titanium and titanium alloys.

We CERTIFY the metal that lets it fly faster

■ Mallory-Sharon, a leading producer of titanium and titanium alloys has helped this new material meet the demanding requirements of aerospace aircraft by quality proofing like these:

Unsurpassed machinability. One of the early byproducts of titanium was the element carbon, which, if present even in small quantities made the metal hard to machine. Mallory-Sharon developed a non-oxide electrode double melting, which enables us to guarantee a maximum carbon content of one-tenth of one per cent. At this level titanium machines as readily as stainless steel.

Certified Properties. By introducing statistical quality control methods to production, we've not only improved quality, but can certify physical properties of each heat within definite limits. This has simplified production tooling and reduced costs for fabricators. With improvements like these, titanium's use is rapidly expanding... saving hundreds of pounds in overall weight... or serving as a corrosion-resistant material in other products. For quality you can depend on, call us for your requirements in strength, lightweight, corrosion-resistant titanium.

Reads like a roll call of American aviation, doesn't it? From small single-seaters to giant bombers and ponderous blimps, all have one thing in common—Lord bonded-rubber engine mountings to isolate power plant vibrations. This roll call indicates the past and present use of Lord engine mountings. As new milestones in aircraft propulsion are achieved—in turboprop, jet and reciprocating—Lord will continue to provide its ability to produce new mountings with greater control over propeller disturbances and engine vibration. They will assure less flight fatigue, greater passenger comfort and protection to aircraft structure. Look to Lord for the best in vibration control.

Rockwell International Corp., Downey, Calif. 100,000,000, 67% allowed.

Grumman Aircraft Corp., Bethany, Conn. 100,000,000, 67% allowed.

Consolidated Aircraft Corp., St. Louis, Mo. 100,000,000, 67% allowed.

North American Aviation Inc., Torrance, Calif. 100,000,000, 67% allowed.

Rockwell International Corp., Downey, Calif. 100,000,000, 67% allowed.

Every excess ounce costs its weight in Gold!

Excess aircraft weight is estimated to cost \$500 a pound in terms of maintaining strength and performance... or just about the cost of gold!

It's a high price to pay for needless weight—particularly excess weight. But Leland Inerters savings every pound lost the military weight specifications. Not they meet or surpass all other military specifications.

Take a look at the chart below. See the weight savings Leland engineering shifts make possible. Bring your AC or DC power supply requirements to Leland. And see why, in aircraft power generation, Leland leads all others.

\$6,000 Ft. Inverters to MA-1-70322

Leland P.F.s	Military Specification	Term Weight	Rated Weight	Rating
ST-102	MA-1-70322/AF Type 70322	45	40.0	4 lbs. or 80,000
SG-102	MA-1-70322/AF Type 70322	45	34.0	4 lbs. or 80,000
SG-102	MA-1-70322/AF Type 70322	45	40.0	4 lbs. or 80,000
SG-102	MA-1-70322/AF Type 70322	45	34.0	4 lbs. or 80,000
SG-102	MA-1-70322/AF Type 70322	45	40.0	4 lbs. or 80,000
SG-102	MA-1-70322/AF Type 70322	45	34.0	4 lbs. or 80,000

A primary trainer

with true jet performance

The Temco Model 51 is a completely new primary jet trainer with true jet performance. Developed and financed entirely by Temco, it is as advanced as the jet age for which it was designed.

A two-place, tandem, mid-wing plane of simple, light-weight low-cost design, it is rugged and reliable throughout. It has a maximum level flight speed at least 50 mph faster than the quoted performance of any other fully equipped single-jet primary trainer.

Simple and safe enough for a student pilot's first solo, it still incorporates a host of operational jet aircraft systems including among others oxygen seats, liquid oxygen and hydraulic speed brakes. In design and performance, the Model 51 has been engineered without compromise to meet the jet age requirements of military training commands.

FACTS ABOUT THE TEMCO MODEL 51 JET TRAINER

Engine	Continental T240-TT turbo-jet
Gross Weight	4,137 pounds
Total Capacity	545 gallons
Ultimate Load	11.33 Gs
Maximum Dive Speed	450 knots
Maximum Speed (15,000 ft.)	380 knots
Cruise Speed (25,000 ft.)	315 knots
Stall Speed	63 knots
Service Ceiling	35,000 ft.
Rate of Climb	1,980 ft./sec.

AIRCRAFT CORPORATION DALLAS

BUSINESS FLYING

AiResearch Building \$600,000 Facility for Business Flyers

By Bruce Long

Los Angeles—To keep up with an increasing demand by business aircraft owners for maintenance and service, Garrett Corp.'s Afterservice Aviation Service Division will move into a new \$600,000 facility at Los Angeles International Airport late this year.

Under construction as four hangars, each large enough to shelter a Constellation, a pilot's lounge, customer service stretch and administrative building.

Afterservice Aviation Service is a business J.C. Garrett president started in 1964, about 20 years ago when he bought one of the first turbo DC-3s or jets.

Wanted to find anyone at that time, to modify the engine, interior make a comfortable and efficient executive-type airplane, Garrett turned to his own company's service subsidiaries, even for the conversion.

Today, Aviation Service is a 300-man

operation and a separate division of the Garrett Corp. It has jet engines on its service roster about 110 different types of aircraft. Last month the division was selected by American Airlines to design and build the hangar, main for the airline's DC-7. "Real Goodman" says another recent contract calls for building hangar interiors, specially styled by Douglas Aircraft Co. for DC-7Cs on order for Pan American, Brazil Airways, Canadian Pacific and Transair airlines.

The largest corporation flock it has worked on is General Motors, involved in the armed forces. They've made plans for Laquisha, California, Detroit, Douglas Aircraft Co. says. Richard & Co., main oil unit parent and a fleet of 500 bombers in the region for Los Angeles Airbase when it expanded from an all-out in a passenger airline.

Recently this converted the first production line General 140 Metropolitan

for executive Airbus for Cities Service Oil Co., New York, and installed on-line back engines in its U.S. Air Force, General 440.

Business aviation requirements of business corporations vary widely, the company reports and accordingly, prices vary. A DC-3 jet and from \$25,000 up to \$350,000. The reason is the cost of the DC-3 Aviation Service, some times will not only the interior but the plane, as well as a package. Otherwise, DC-3 interiors run up to \$60,000. Constellation interior run from \$75,000 to \$160,000. Lockheed from \$20,000 to \$60,000. Twin Beechcraft can be custom modified for \$2,500 to \$7,000.

Typical Conversion

What does a company get for such an investment?

A typical DC-3 jet starts with upgrading the old interior and then stripping the plane in the bare airframe to make custom it is structurally sound. More steps that follow in the modification program include:

• Larger engine. Aviation Service says that the Pratt & Whitney R1500-37 engine is replaced by the more powerful R1500-39A. The new

Weejet Navy Trainer

New Comac Weejet side-by-side primary jet trainer takes out the latest during its flight test program before making Navy deliveries. Powered by a single 700-hp, three Continental JET-10, the Weejet's top speed is more than 300 mph at sea level (VW April 16 p. 34). It has exceeded 350 mph in test dives. Gross weight is 3,400 lb. with 112 gal. of fuel. Provision has been made for fitting auxiliary storage fuel tanks holding 30 gal. each.

JET POWER TODAY

The Navy's new F-4 FURY Jet Fighter is now undergoing its carrier trials. Newest in the FURY family of carrier-based jets, the F-4 climbs faster, maneuvers at higher altitudes, with longer range. This new and faster FURY is a product of North American's Columbus Division—a completely integrated aircraft engineering and production center where over 10,000 more potent aircraft are in continuing development. North American Aviation is a prime supplier of advanced aircraft to the Department of Defense.

AT 100,000 FEET, THE X-15 REACHES HYPERSOUND

SPACE POWER TOMORROW

The SM-64 NAVAHQ Intercontinental Guided Missile is a logical partner of our continuing development of supersonic, guided aircraft. Security restrictions prohibit any details—but we can say that the NAVAHQ will fly great distances at speeds far beyond supersonic. It will be guided and flown by automatic controls, driven by high thrust rocket power. The NAVAHQ extends the striking power and long range defense of our nation further than ever before.

North American Aviation, Inc., Los Angeles, Santa Ana, Irvine, Dallas, Columbus, O.

NORTH AMERICAN AVIATION, INC.

Engineers write for details regarding challenging positions also open.

Salute to America's global "keepers of the peace"!

At the top, southeast, miles above the earth, a distant view of the Strategic Air Command are leaving through silent space on precision, combat-ready training missions. Some are high over a polar scrap, or far out over the ocean. Other SAC crews, and their jet bombers, are posed on American and overseas bases, ready for instant action.

At any moment, day or night, SAC's training operations can be changed into combat operations, unleashing mighty retaliatory nuclear strikes against the war-making power of any aggressor, anywhere.

As the potential wielder of this mas-

sive force, Strategic Air Command has, since its founding ten years ago, been known as the free world's "keeper of the peace."

To maintain this great force on the latest edge of readiness, SAC crew-ground and flight—operate around the clock on a combat alert base. Flights and missions follow eight-second turn-times. Entire wings, accompanied by aerial tankers and tankers, are alerted in regular training operations to bases in England and North Africa.

Last year, Strategic Air Command's legions of the peace flew over 330,000 individual missions, totaling more

than 1,000,000 hours of flying time.

On this 10th anniversary of the founding of SAC, the men and women of Boeing give a grateful nation in salute the men of the Strategic Air Command. Boeing is proud that, over the decade, it has been privileged to work as a partner, designing and building SAC's tankers and bombardment aircraft. The Strategic Air Command's Boeing range from its first B-29s and B-50s to today's rugged KC-97 tankers with six jet B-47 medium bombers, the lightweight B-52 intercontinental bomber and the KC-119 jet tank-transport now under construction.

BOEING

engines increase takeoff horsepower from 1,200 to 1,350, step up cruising speed 20 mph and increase gross weight capacity by 3,700 lb.

• **New cow flap.** Aviation Service will develop cow flaps. Flaps on the top half of the engine nacelle are "fixed," while those around lower half are controllable. This cuts down air passing over engine, so that it runs better, gives better performance. New flaps also reduce maintenance and weight costs.

• **Ground-sidder trim tabs.** Aviation Service's tab mechanism, mechanically boost linked to the trim tabs and reduces forces on the left. When the full 1,350 hp is used for takeoff, the company says, it is essential to have the tab working.

• **Ground-sidder trim tabs.** The new sidder trim tabs function similar to the sidder trim tabs. The larger engines, teamed with ground sidder and sidder trim tabs, give higher cruising speed which permits increase of climbable gross weight to 35,000 lb. The sidder trim tabs can be used with the sidder engines for added safety.

• **Extra fuel tanks with gross weight increase.** Extra fuel tanks are installed in outer wing panels. With 330 gallons of extra fuel in each wing, range of the DC-3 is extended about 500 miles at average cruising speed, under average weather conditions.

• **Personnel and machine interiors.** In many ways designed to make every inch useful. Custom tailored furniture, cabin nets, overhead lights, doors and reclining wheel seats all are styled and tailored in Aviation Service shops. Cabins are comfortable and lighting system also are installed by the company.

For Lockheed Lockheed operates the company designs and fabricates various fuel cell installations to replace the regular tanks, and does a complete stock analysis of the wing structure and a vibration test of the outer wing panels.

For Convair 740 operates a design and fabricates portable collapsible towers and an structural modifications that substantially reduce wing levels in the cabin.

Considering that business Boeing has last year represented a 45% gain over 1951's 2,350,000 hours, it is under stands that Aviation Service acts, its great success. During its growth, Aviation Service got over the peaks and valleys of its type of business by concentrating on "specialty items," such as engine modifications and DC-3 wings that can be traded in for wings with special needs.

It enlarged its business volume by a new radio and electronics department. "By the design, plans, construction of completely new radio and communications equipment, in addition to radio installations," says Jack O'Brien, vice-

AD Landing Gear

Yesterday—in the important airborne phase of our business—just back two decades to the middle 30s when Interstate was widely known for producing the famous Cessna airplanes. As World War II threatened, however, expanded to the production of military buses and training planes. During the war, Lockheed selected Interstate to build the fuselage section of the military B-17 Flying Fortress. Before the war ended, Interstate had produced more than 250 million worth of material for the armed forces!

Today Interstate is on the team with the production of airborne components for the new war Douglas AD Skyraider and later initiated the complete fuselage for the same. For the past year and a half, Interstate has been proud of its assignment to build the AD fuselage.

Interstate starts with tomorrow's designs and extends to all past years' needs for airborne components. Interstate will deliver and assemble airborne components to the specifications of your company!

Interstate has the facilities and equipment—wide headroom!—to meet all modern demands for airborne components! Transportation readily available!

Please, write or wire for complete brochure detailing our equipment and production background.

ager of AdResearch Aviation Service. The company can conduct rainfall, RCA, Boeing or Collins weather radar systems.

Cord Aircrafts Administration recently approved the company's development DC-10-47 nose modification kit and radars.

AdResearch Aviation Service does not regard itself primarily as an executive interior outfit. It is concentrating more and more on general and specific aircraft overhaul, ground service, engine trouble and repair, along with special stores.

Cessna Earnings Up, Boost in Dividend

A 45% increase in sales for the first six months of the current fiscal year has led Cessna Aircraft Co. to declare its income, from 25 cents to 35 cents in its quarterly dividend, boosting annual payments from \$1 to \$1.40.

Cessna sales totaled \$11,160,000 for the six months ended March 31, compared to \$7,710,000 in the same period last year. The increase was due mainly to business aircraft sales, more than doubling; civil aircraft sales of \$10,477,000, increased the percentage of Cessna's non-military business to approximately 95%.

Earnings for the first six months were \$2.95 per share compared to \$2.01 in the same period last year.

The company delivered 1,200 aircraft in the six months, compared with 850 units shipped in the like period last year.

Cessna's new tractor landing gear models 172 and 182 are credited with being largely responsible for the increased volume of commercial business.

Military police contracts include production of the T-37 Tweet, and by the time Interstate began production in July.

On the basis of present contracts, L-19 output will continue through 1957.

Insurance Liberalized For Private Flyers

Liberalized rules for issuance of life insurance to non-operators of planes as business pilots are now in effect with 85% of approximately 100,000 aircraft monthly serviced in the Insurance of Life Insurance, New York. At the time it made its last survey, in 1948, no company was known to be issuing

FLOW MEASUREMENT IS OUR BUSINESS...

For more than twenty-five years we have produced specialized equipment for the measurement of flow in the oil and gas industry. Detailed equipment can aid in the solution of problems in flow measurement peculiar to the aircraft industry, too.

For low cost, greater accuracy, and simplification of your flow measurement problems, consult the pioneer in the field.

Why let routine work slow your advancement

...when varied, creative assignments, with high promotion potential, are open at Republic Aviation

It's easy to be so busy that you fail to realize that the work you're doing often offers little opportunity to grow in professional knowledge and advance rapidly in individual achievement.

At Republic Aviation, however, the very nature of this highly competitive business creates a constant flow of new and stimulating problems. Every new aircraft design created at Republic starts with a real advance in the "state of the art." Pioneered at Republic is all the famous planes that bear its name — the P-44 Thunderbolt, P-46 Thunderbolt, RF-44 Thunderbolt, and the remarkable new F-108, F-107 and F-105 — the real American Jet in flight or on the ground.

And your personal life is in its proper place, when you work for Republic. You live on long Island, famous vacation land where you can keep your own boat or board a charter fishing boat any weekend. Play golf, swim, even polo, and yet downtown New York is at your doorstep.

You enjoy, too, the practical, personal advantages of Republic's comprehensive benefit program including:

REPUBLIC'S NEW 2-FOLD RETIREMENT INCOME PLAN that's the talk of the industry. Part I provides a basic Retirement Income, paid in full by Republic. Part II is optional. It offers additional income on a fixed annuity basis, the company paying over 50%.

REPUBLIC SALARIES ARE HIGH — among the highest in the industry — and these are permanent jobs.

OTHER OUTSTANDING BENEFITS include an all-expense paid relocation plan for qualified engineers living outside the New York-Long Island area. Life, Accident and Health Insurance, Hospital-Disability Benefits for the whole family, Educational Aid covering 5% of the cost of advanced study.

POSITIONS ARE OPEN AT ALL LEVELS IN:

Aerodynamics • Systems • Propulsion • Operations Research • Dynamics • Metals • Controls • Electronics • Staff Engineering • Electromechanics • Flight Test • Research • Thermodynamics • Fluids & Hydraulics • Test Plans • Weapons Systems Analysis • Service • Airframe & Mechanical Design • Avionics Computers • Avionics • Control Systems • Instrumentation

Plan your future as a Flight Officer with United Air Lines!

Meet us now for a booklet outlining your career opportunities with United Air Lines, the nation's fastest growing airline.

Qualifications: ...a commercial pilot's license with 250 hours or more (no multi-engine time required), AUI 81 license and a high school graduate between 21 and 30, between 5' 7" and 6' 6" in height, and able to pass a flight physical without incident. Applicants with CAA A instrument rating or flight engineer training or previous pilot experience will be accepted through age 31, with both, through 35. Successful applicants attend United's Flight Training Center at Denver and receive pay while training.

Excellent pay: ...\$450 a month as a sign-on bonus. In time, pay increases at regular intervals.

Security: ...broader insurance program, plus retirement income plan and other generous benefits.

Even if you are not now able to take advantage of this great opportunity, plan for a future with United Air Lines. Mail coupon today!

Why Lockheed offers Engineers better careers

There are three main reasons:

- 1. More opportunity for promotion**
because there are more opportunity positions to be filled with 46 major projects underway, including 13 models of aircraft in assembly here.
- 2. More career security**
because Lockheed activities cover virtually the entire spectrum of aerospace endeavor.
- 3. Life in Southern California.**
Sunny beauty, unspoiled climate, wide recreational opportunities enhance life in the San Francisco Valley.

To Engineers who lack aircraft experience: Aircraft experience is not necessary to join Lockheed. It's your engineering training and experience that count. Lockheed trains you for aircraft engineering—in full pay.

Compare below is for your convenience in requesting application form and more information on how Lockheed's expanding program can advance your career:

ENGINEERS and SCIENTISTS

We have real opportunities available!

The Mechanical Division of General Mills has varied and rewarding openings in a wide range of fields. We have continuing and interestingly growing work for scientists and engineers with whom you can work. We believe we have all the opportunities you could find elsewhere in the country.

Our engineering and research facilities and laboratories are growing rapidly and we have many immediate openings for personnel positions. We are particularly interested in people who have not provided and value an exciting place where they can use it. We want people who want challenge and opportunity. Our openings range from those too important all the way to top technical specialists.

The types of work on which you could be engaged include:

- | | |
|---|---|
| <ul style="list-style-type: none"> Resinics Applied mechanics Deformation mechanics Dyeing and textile processes Composites science Instruments and controls Solid state physics | <ul style="list-style-type: none"> Belts Automated systems Medical systems Thermodynamics Industrial engineering Flow profile technology Surface chemistry |
|---|---|

We need outstanding accomplished physical, chemical and electrical engineers, physicists, metallurgists, chemical and electro-chemical, food technologists through doctor's degrees.

Exciting associates and atmosphere. Aids and progressive organizations. Recognize the your contribution. Our country has never been better in the present, war-time, and living conditions.

We have been steadily building together for five years and development still in its infancy. We are very proud of the people in it. If you are of top flight caliber and want to work closely with those who are also, we invite you to send us a resume which will be held in strict confidence. Address: Peter D. Burgess, Director of Personnel.

Fort Wayne, Ind. "America's Happiest City"

Dear Bill:

Now that Joe is on the team here at Farnsworth, he's asked me to write and give you the same story that got him interested in coming with us.

Actually, Bill, it wasn't a "story." Just a few honest-to-goodness reasons why he and Marge should make the move and let the family really live as well as let Joe grow professionally.

For instance, do you know what "sold" Marge? The fact that in living here you are only 10 minutes from everywhere—schools, churches, stores, etc., and Joe goes home for lunch every day instead of work and she also liked the idea of some 300 lakes within 10 miles. (Guess where they're planning to spend the summer!)

As for Joe, he's all hooked up about the work he's doing on such missiles as Bomarc, Talos, Terrier and others. Says the top-notch scientist and engineer he's working with are all big boys and he's on the team.

That's about it, Bill. An engineer with your talents shouldn't be wasting around when he can get in on the ground floor here at Farnsworth in research, development or production engineering in missile guidance and control, radar, microwave, test equipment, counter-measures, transmitter applications, etc.

So—why not write, right now to Don Rhome, Farnsworth Electronics Co., Fort Wayne, Ind. (A division of International Telephone and Telegraph Corp.).

You, Joe, I and Farnsworth will be mighty glad you did.

Sincerely, Jack

ENGINEERS TECHNICIANS

Investigate Opportunities at
ERCO DIVISION
OF ACF INDUSTRIES INC.

ERCO Engineers have built a record of continuous progress and growth for themselves, and for the Company for a quarter of a century... growth in physical plant, personnel, number and diversity of products and services.

Today this growth continues and we are constantly on the alert for new ways to add fresh impetus to that progress... paying top salaries to capable people.

You will be interesting and stimulating... it might include electronics flight simulators, tracking tools, guided missiles, or a variety of specialized electronic devices.

For us there's a home for a number of full-time residential crew members in both sleeping quarters and plant... and you can further your education at the many nearby Universities... you can enjoy suburban living and be within easy reach of the cultural advantages of the Baltimore Capital.

ERCO now needs Electronic Engineers (all levels with some degrees preferred), Aerodynamics, Analog Computer Engineers, Mechanical Design Engineers, and supporting personnel. Send resume at request for additional information to:

DEVELOPMENT ENGINEERS

Honeywell's Aerospace Division one of several Honeywell
Divisions specializing in aerospace controls. At Honeywell we have
specialists in guidance and control in flight and on the ground and in
the air, and in the development of control systems for aerospace
vehicles and engine controls.

■ The development engineers are open for aerodynamic, ge-
ometric and electrical engineers. This means complex design
and development responsibilities for components and systems
in the field of aerospace. Full management, systems, technical
guidance, systems, control and test group, subsurface design,
design, and many others.

■ As a design engineer you will provide technical direction for
aerodynamic, mechanical, control systems and electrical engineers
assigned to the project. An engineering degree is required and
five practical experience with control or control equipment is
required.

CONSIDER THESE ADVANTAGES

- Minneapolis, the city of lakes and parks, offers you a most
pleasant living in a suburban atmosphere. No commuting.
- Your travel and family living expenses paid.
- Salaries, incentive programs, profit and interest
bonuses are all first class.
- Honeywell, leader in control systems, manufacturing of over
15,000 different products, offers unusual advancement and
variety. A sound growth company, constantly expanding, it
offers permanent opportunity to you.

LETTERS

Tu-104 Clues

Your article in the *Tropics* 104 was very interesting reading. There was a flaw in the article concerning the origin mutation. It appeared on the second page, para. (1) "Half-Horse disease".

circumfered the diameter of the logs, or rotunda in 40 inches (2). The extreme north diameter is calculated a third, last (3). Overall length of the engine, nozzle is approximately 40 feet (4) and maximum diameter is 44 feet (5) — the engine seemed unusually quiet in view of their size although there was no indication of exhaust.²²

In the author's opinion, there is one engine configuration that fits the five clues 100% and is a diesel engine. Such an engine might look like the following chart:

The advantages of such an unit filter could be: (1) increased flow; (2) reduced size; (3) reduced capital costs. For more information, Richard Engstrom, General Electric Co., Cincinnati, Ohio.

AW 'Addict'

As a highly-esteemed subscriber to "You, Mrs. Ward," I have been desirous of writing you for some time, some time.

It is strange to say that one can become "addicted" to a magazine, but after reading each issue, I actually became impressed by the great *Weekend* to write. The reason for this should be apparent to you in the following, and can be evidenced from your own study, and my own collection. "Sincerely, WICK," a salient question, the first and most complete magazine devoted to the "Weekend Industry"—created by far and restoring. The industry, in all its most places and dimensions. I am so fortunate that you have published that I find it impossible to police, or attend to. READ TO YOU.

[illegible]

Arrested Work welcomes the opinion of its readers on the issues raised in the magazine's editorial columns. Address letters to the Editor, Arrested Work, 230 E. 42 St., New York 17, N. Y. Try to keep letters under 500 words and give a precise identification. We will not print anonymous letters, but names of writers will be withheld on request.

articles specify heights of cone cross-sections and align with the ultimate function of a Pali *śāstra*—the development of a coherent and stable as an important measure, serving as both a medium of expression and the means for function of an *śāstra*.

Accident Experts

One of the major problems which must be solved before the publication of the new health-related information at the time of the next meeting of the Commission on the Status of Women is the problem of publishing the CSM. As yet, no decision has been made as to whether the CSM should be published in a separate volume or as an appendix to the main report. The Commission is also faced with the problem of publishing the CSM in a language which is accessible to all. The Commission is also faced with the problem of publishing the CSM in a language which is accessible to all. The Commission is also faced with the problem of publishing the CSM in a language which is accessible to all.

 always would do

Keywords

Dr. posthumus. Captain Robison happens to be on a list of some type—possibly his own intended apologies for accusing you, or others, of disloyalty. However, if it was "Archie" Walker's death, to discuss times like "Cockat Vespene" article, then you can be diplomatic for the apparent lack of truth in citizenship. It is the only possible reference of A-0, that I can find but this does not deny the magnitude

Rural Institute Ltd. 122 East 42nd St.,
New York 17, New York

(Cf. *Capt. Rahoon's* column = *Clockjet's* *Yan-pan* = a regular feature of *AVANTAGE*. While *Yan-pan* refers to willow trees in such *Capt. Rahoon's* as an *olive* pine with a full schedule of transport flying and her riding must be cancelled in favour of his value status. This accounts for occasional lapses in the appearance of the column — *Pf*.)

Engineer's Pay

I have to laugh at all the complex and varied reasons given for the engineering shortage. It's quite simple. Engineering companies pay a very predominant index because as the pay rises, good things happen: the students maintain that ideal gap with the built-up pay with valuable knowledge among all people that engineers have, can, possess, push, and this in turn makes many people feel that as engineers it is a very superior person that

Harvey extrusions...
simpler, smoother
parts for better
flight

Improperly installed rivets and bolts have always contributed heavily to the turbulence and drag that downgrade a plane's over-all performance. On light-gage skins, disruption results — on medium rivets, rivets can be countersunk, but often end up below the desired surface — the steel bolts used on heavy skins just can't be shoved to surface smoothness.

Harvey Aluminum Extrusions combine slim, open, and stiffened in to go panels, virtually eliminate rivets and bolts, thus achieve a degree of aerodynamic smoothness that reduces operating costs and improves performance. And at the same time, assembly is faster, scaling is eliminated, and inspection is simplified.

There is a leading independent producer of aluminum extrusions in all sizes and of all alloy grades including 6061-T6 aluminum extrusions, specifically and also for casting steel pipe, pipe hangers, castings, aluminum and stainless steel forgings and other products. Also various products in steel and aluminum applications.

NATIONAL AIRLINES

AIRLINE OF THE STARS

CHOOSES ALLISON TURBO-PROP ENGINES

and AeroProducts Propellers for new fleet of over-400-mile-an-hour
Lockheed Electras, World's most luxurious airliners

National's fleet of twenty-three new Allison-powered Lockheed Electras will give passengers jet-age speed, comfort and performance between 37 cities in the U.S. and Cuba.

Pioneering a whole new generation of U.S. air transports, these Allison-powered Electras will give you:

FASTER FLIGHTS than in any airliner now flying—cruising speeds of over 400 miles an hour

RAPID TAKE-OFFS from airports now regularly served

HIGHER CRUISING ALTITUDE for greater latitude in selecting favorable flying conditions

NEW COMFORT AND CONVENIENCE—unprecedented new standards of smooth, quiet, restful air travel

HIGHEST DEPENDABILITY—proved by Allison's record of more than 8 million hours of turbine engine flight time

The Allison Turbo-Prop is a gas turbine engine, similar to a jet, but its tremendous power is geared to a matched AeroProducts Propeller for higher efficiency and better fuel economy.

With Allison Turbo-Prop power—a matched engine-propeller team—General Motors again demonstrates its leadership in the development of more efficient power for all kinds of transportation.

Our sincere congratulations to National Airlines on their choice of this great new power—an outstanding contribution to the never-ending progress of our nation's air travel.
